Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY, San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 30 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them.

At Booth & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR.

For sale, the right to build and use in Mills. A working plan will be furnished to each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS For Steam Engines.

Giffard's Injectors, For Feeding Boilers.

STODDART'S IRON WORKS, Beale Street, San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

W. M. P. BLAKE, Corner First and Mission streets, or Box 2,077 3v13f SAN FRANCISCO.

E. O. HUNT,

Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have their sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING WIND MILLS are strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Favorable to Inventors.—Persons holding new inventions of important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability.

- No. 1.—Or 9-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bolted with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and the fixed jaw. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. O represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, O, gives the movable jaw, B, a forward and downward motion; at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

LEFFEL'S American Double Turbine WATER WHEEL.

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested on this coast, more than 100 times in use, at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc.

FIRST Paint Manufactory IN CALIFORNIA.

EPES & E. H. R. ELLERY Have the Patent Right for the Pacific Coast to manufacture, sell and use

Ellery's Patent India Rubber Cement & Paint. It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. Asperity Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Cement and Paint every two years since keeps it in good condition. We can refer to many others. The Atlanta Lead Works use our Paint only.

NEW CLOTH ROOFS put on; copings and all seems combed and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—for eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted oil tin roofs of Dr. H. D. Cogswell, Furbus & Co., D. J. Oliver, etc., and the wood work of Sherid Clark's building, 83-cent front on Franklin street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and oil of turpentine, dissolved in linseed oil, mixed with the various coloring matters, and ground in my color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No equal in quality or cost for use. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

NELSON & DOBLE, AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, Cerman, Plow, Blister and Toe Calk Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools.

PATTINSON'S HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use. Notice is hereby given that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. THOMAS PATTINSON. 7v15-4f

NEW YORK PRICES.

C. E. COLLINS, No. 603 Montgomery street, San Francisco. EXCLUSIVE AGENT FOR THE AMERICAN WATCH FACTORY.

A large assortment of these Superior Watches, In Gold and Silver Cases, Constantly on hand, and sold at Factory prices. Also, ENGLISH AND SWISS WATCHES, Imported directly from the Manufacturers.

The American Company are now making VERY FINE WATCHES FOR LADIES. A large assortment of Gold Chains and Jewelry. 25v10-6m

NEW YORK PRICES. THE GREAT LIGHT. THE DANFORD Atmospheric Lamp.

This Lamp burns coal oil, requires no chimney, gives a pure white and steady flame, uses thirty per cent less oil than any other Lamp in proportion to the amount of light afforded, and is absolutely indispensable in every house where gas is not used. CALL AND SEE THEM FOR SALE only at 417 Washington street, opp. Post Office, S. F.

Assayer and Chemist.

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office. 3v15v1

Just Published. THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON FUNCTIONS AND DISORDERS OF THE Nervous System and Reproductive Organs, to be had by addressing and inclosing twenty-five cents, postage stamps to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 12v13-1v

Notice to Miners, Well-Borers and Water Companies. M. PRAO IS NOW PREPARED TO MANUFACTURE M. Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the best improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAO, 8v13-1v Stove Store, No. 125 Clay street, below Davis.

Mechanical Drawings. Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

Disastrous Condition of Mining in Cornwall.

We have several times alluded to the present disastrous condition of mining in Cornwall, England. In a recent official inquiry, by a committee of Parliament, into the condition of the mines in that portion of Great Britain, Mr. Robert Hunt testified as follows:

I was formerly a professor of physics in the School of Mines, and am now Keeper of the Mining Records in the Jermyn street Museum. I am well acquainted with practical mining, and with Cornwall, having lived for many years in that county, and since 1839 been officially connected with it. For six years I was Secretary of the Royal Cornish Metallurgical Society, and for the remaining period Keeper of the Mining Records, which has constantly occasioned my intercourse with Cornwall. In March and April of this year I was six weeks in the county, and visited the mines of Cornwall and Devonshire, with the special view of obtaining accurate information, for official purposes, with respect to the condition of those mines. Nothing can be conceived in a more disastrous condition than Cornish and Devonshire mining at the present time.

It is worse than it has been at any other time since 1839. The mines actually at work in 1861 were 543; in 1864 the number rose to 616, but in the months that I was in the county in 1867 they fell to 320. The number of dividend paying mines in 1861 was 58; at the end of 1866 there were 26. The amount of the produce of the mines within the Stannaries in 1861 was 190,778 tons of copper ore, having a value of 1,004,915.

In 1866 there were produced 138,141 tons of ore, having a value of 582,546. The produce of the tin mines in 1861 was 10,963 tons of ore, having a value of 793,698. In 1866 there was produced 15,089 tons of ore, having a value of 754,000. In 1861 there were in Devonshire 2,364 miners above 20 years of age, and in Cornwall 19,159, making a total of 21,523 miners of and above the age of 20. Within the last 18 months 7,350 miners have left Cornwall and Devonshire, and 11,321 have been thrown out of employment, leaving 3,941 at present remaining in the district thrown out of employment; and this number will be increased by about 500, who have been thrown out of employment by the stoppage, a fortnight ago, of the St. Day United Mines. These 7,370 men who have left the country have left about 20,000 behind them who were dependent upon them, and there are about 50,000 dependent upon those who are left, making altogether about 70,000 dependent upon the industry of the miners above 20 years of age. In making this computation, I have left the lead mines of Cornwall out of the calculation; what I have said applies only to the copper and tin mines in the Stannaries. Of the 26 dividend paying mines within the Stannaries, some are making far larger returns than others; some are actually paying dividends out of reserve capital. Under the circumstances just mentioned, seeing that so large a number of mines in Cornwall are being worked at present at a loss, the adventurers generally would, I believe, be too glad to have the excuse of an additional burden in the shape of rates to get rid of the cost which they are now incurring, and a large number of mines would be closed. I have read the Bill now before the Committee, and understood it that the occupiers would be rated, and it is my impression that the effect of the passing of the Bill as it is now before us would be what I have just described.—[Witness then read several letters from several districts supporting his statements.]

It was testified by Mr. Leeman that a large number of the best miners had gone to California and Lake Superior. About 1,500 have gone to Australia and New Zealand.

Mr. Kendall testified that the men who had thus gone were the best—young, active, self-reliant men, who have made a little money, and who are able to move.

Mr. Kendall further testified as follows: Chili now produces more than one-half the copper of the world, and the consequence of a war with Chili or America would be that our Chilean copper would come to England. If there were war with America, it would not only play the mischief with our smelting trade in copper, but with our manufacturing trade in copper, which is now enormous. Besides, the effect upon the mines would be too late; the mines would be shut up. Many of them are 200 or 300 fathoms deep, and would all be full of water.

**TROPICAL FRUITS IN CALIFORNIA.**—An enthusiastic agriculturist in the southern part of the State, who has spent many years in Africa, latitude 4° north, writes to the *Atlas* that he is confident that the lower counties of California will produce bananas, pine-apples, plantains and rice, and he hopes to see coffee reckoned among the products of "this glorious country." He has sent to Liberia for palm nuts, cocoa, coffee, mango, plums and other vegetable productions of that region, believing that some of them can be made to grow and bear well here. At any rate, the experiment is worth trying, and everybody who wishes well of the State will be glad to hear of the success of this and similar experiments that are now being tried. Banana bulbs have been planted in this vicinity within a few weeks, are doing well and exhibiting healthy signs of life and vigor; one planted two or three weeks since, has grown leaves over eight inches long.

**SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL.**

Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 23, 1867.

TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Batts, etc. per session of ten months, \$35.

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

REV. A. MASNATA, S. J., President.

**The Commercial Herald**

**MARKET REVIEW**

Will be issued early on EVERY STEAMER-DAY MORNING. (TRI-MONTHLY).

Office—Southwest corner Washington and Battery streets, Opposite Post Office and Custom House.

The HERALD will contain full and reliable commercial details, and elaborate articles on the monetary affairs of the Pacific Coast.

The Letter Sheet Market Review, containing selections from the COMMERCIAL HERALD, printed on tissue paper, for transmission abroad, will be published simultaneously with that paper. Also, published in each office of the

**Weekly Stock Circular.**

Merchants can have their cards prominently inserted in the Letter Sheet MARKET REVIEW.

**Golden City Chemical Works.**

CAPITAL STOCK, --- \$500,000

Trustees: H. P. WAKELEE, THOS. H. SELBY, NICHOLAS LUNING, THOS. BELL, CHAS. E. McLANE.

H. P. WAKELEE, MANAGER.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muriatic Acids of superior quality, in quantities to suit.

Orders will be received at the office on y for Chemicals of every description, which will be manufactured as they may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed.

**HAYWARD & COLEMAN, IMPORTERS AND REFINERS**

**Illuminating, Lubricating, PAINT OILS!**

CONSISTING OF KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS, NEATFOOT, BOILED AND RAW LINSSEED, CASTOR AND CHINA NUT.

**SPIRITS OF TURPENTINE & ALCOHOL**

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial. **Lamps and Lamp Stock!** An elegant and complete assortment on hand. 19v13-3m 414 Front street, San Francisco.

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 10th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular millers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old millers and plates is as thorough and perfect as with new ones. The pulp enters readily between the millers and side dies, the pressure being light in front and heaviest at the heel of the miller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pick points or iron, accidentally introduced with the crushed ore, as these can readily pass each miller separately, without interfering with or affecting the other millers, each of which is independent, or can rest upon the bottom below the millers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each miller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the millers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The millers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 5 screens. A "sluicer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

EXPLANATION.—E, muller-hammer, F, muller plate or shoe, G, side dies, L, supporting lip, O, bearing surface, T, feeder, X, weight to counter-balance wear of muller plates, or shoes, U, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

dies are easily removed at any time, or when worn out, and an extra set of millers is furnished with each pan sold. It is also adapted for grinding cement, sulphurates, roasted ores, etc.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or miller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six millers, is about 2700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of millers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$200 gold coin.

For further particulars, apply by letter to PULP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or S. P. KIMBALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circulars. PHILIP HINKLE, and CHARLES S. CAPP, Patentees, 513 Clay street, San Francisco. 25v14-1f

**Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, AND ZOOLOGICAL GARDENS.**

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only, first-class suburban resort on the Pacific Coast. The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic. To all departments new attractions are being constantly added. These Gardens are accessible by the Howard, Folsom and Market street Cars. Entrances on Mission and Valencuela streets, between Thirteenth and Fourteenth. OPEN EVERY DAY. Admission to all parts, 25 Cents. Children, under 12 years, half price. 25v14-1r

**THE WILCOX & GIBBS IMPROVED NOISELESS Family Sewing Machine** Challenges the world. It has beaten the Florence badly Come and see it, or send for Report of the trial. SAMUEL SWIFT, Agent, 03 Kearny street, near Sutter. 13v14-6m

**Pratt's Abolition Oil.**

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBEYLE & CO., Druggists and Chemists, 524 Sacramento street, opposite What Cheer House, San Francisco. 10v14-1y

**GOVERNMENT HOUSE,**

Corner of Sansome and Washington sts. SAN FRANCISCO, CAL. THE STREET CARS PASS THIS HOUSE IN every direction every ten minutes. The rooms of the House are well furnished, large and airy, and are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half day or are required to pay at hotels. SANBORN & CO 19v13-6m

**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be set up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages. Also, Portable Saw and Grist Mills. For sale by TREADWELL & CO., 9v14-6m15p Corner of Front and Market streets.

**THE POORMAN LODE.**—A geologist, who has closely examined the Poorman lode in Idaho, and which has been found to be so fabulously rich, thus gives his opinion of its origin;

Its soft veinstone has been extensively acted upon by the steam vapors and effluvia of hot water. Probably it might have been the vent of some ancient water volcano. The boiled, rotten and sodden character of its wall rock looks like this. If this crevice had been for ages a boiling salt salfatora or mud volcano, whose walls are often slipping and grinding upon each other, and whose rocks were softening, and the rich sulphurets and ruby ores were slowly changing to chlorides, till at last it became quiet and full, we have, in my opinion, a fair theory for this celebrated vein.

**RAIN IN SISKIYOU.**—The Yreka Union chronicles the occurrence of a very heavy rain storm which fell in the vicinity of the Deadwood Mountains, in that county on the 9th inst. The district embraced by the rain was about fifteen miles in length and four or five in breadth. The rain was accompanied by heavy thunder and vivid flashes of lightning. Outside of this belt nothing more than a few drops fell.

**HENDY'S LATEST IMPROVED CONCENTRATORS,**

**FOR GOLD AND SILVER ORES,**

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

**Directions for Operating Hendy's Concentrators:**

- The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
- FIRST—Set the Pan, A, level, by its inner rim.
- SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
- THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

The above directions, if followed implicitly, are all-sufficient. But, strange as it may appear, the proprietor has found that, in certain cases, they have, owing to the carelessness or to the ignorance of the operators, failed to serve as a complete guide. He, therefore, in the present edition of his circular, insists upon their being followed to the letter; and in order that there may be no mistake in future, he thus elaborates and explains them:

First, then: Unless the pan is level, it is out of the question to expect it to do its duty. One would imagine that the slightest possible examination of the illustrations would be sufficient to show this. Yet, in one case, where the machine did not work satisfactorily, it was found that no regard whatever had been paid to this point! The word level is in itself precise; it admits of no latitude, and cannot be misunderstood. Nothing is easier, to a mechanic, than to place the pan absolutely and mathematically level. It cannot be necessary to dwell further upon this point.

Direction Second, viz:—"Keep the pan about half full of sulphurets," has also, in some cases, been disregarded. A moment's reflection will point out its importance. The operation of the machine is such, that grains of any kind, whatever may be their size or weight, will seek the periphery of the pan, and unless discharged, will there remain, until other grains of greater specific gravity take their place. Of course, then, at the starting of the machine, and for a short time thereafter, the periphery will be partially filled with sand. It is therefore necessary to allow a quantity of sulphurets sufficient to completely occupy that space to accumulate, before the gate is opened, and their discharge commenced. It is obvious that they will otherwise be accompanied with more or less of sand. Once properly commenced, the discharge will be continuous. It must be regulated, however, by the richness, in sulphurets, of the pulp under treatment. A little practice will enable the operator to gauge it without difficulty.

After what has been said, direction Third requires no further explanation. Direction Fourth is, to a mechanic, sufficiently explicit.

These concentrators can be set in pairs, for which a single crank shaft will suffice. Two such pairs can be so arranged as to require a driving shaft of only six feet in length. The guaranteed capacity of each machine is five tons every 24 hours. Eight tons, however, can be and has been put through in that time. The small proportion of sand which the sulphurets carry, when thus rapidly concentrated, is not an objection but rather an advantage, in case the operators themselves intend to work them. Either in roasting or in pan-working, a small admixture of sand is unquestionably an aid. But if the sulphurets are being prepared for sale, they must of course be clean. In this case, the discharges from four machines can be conducted into a single additional one, and the concentration thus be made complete.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

## California Gang Plows.

We herewith present our readers with an illustration and description of what is known as "Baxter's California Gang Plows," manufactured by Webster Brothers, of Stockton. This is a California invention, which has been tested by some of the most thorough farmers in the State, who unite in giving it their unqualified approval. These gangs are made to operate with any number of plows, from two to six, and with or without seed-sowers and harrows, as may be desired, or as the strength of the team and nature of the soil may seem to require. They are also constructed with two styles of

before an opportunity presents for putting in the seed.

One important peculiarity connected with this plow, is that the mold and point are combined in one reversible combination—each mold being provided with two edges, either of which can be used at will. The proprietors have a complete assortment of standards, molds, lands, points, wheels, and other extras for these plows, which will be furnished as may be desired or required. The materials used in the manufacture of these plows are all of the best quality. The wood is Eastern ash; the steel is of the best quality, hardened, tempered and warranted. Both, the plows and seed-sowers, are thor-

productive of results scarcely less in importance to those of the reapers on this side of the Atlantic. The nature and topography of our California lands are much more favorable for such a mode of culture than are the lands of England; and the higher price of labor here must add still further to the value and economy of the substitution of steam therefor. We trust that the Webster Brothers may not be disappointed in the confident anticipations which they entertain with regard to this important and expensive experiment, which they have undertaken. Should success attend this first attempt to introduce steam plowing in California, these gentlemen will be entitled to the highest meed of praise, and will be looked upon as public benefactors.

## Interior Salt Deposits.

The interior salt deposits of the earth, formed chiefly from the early silurian oceans, are supposed to be much more extensive than any similar and more modern deposits now resting upon the earth's surface. As an evidence of the vastness of these ancient deposits, we may instance, among other localities, that near the village of Salina, in the State of New York. The yield of salt from these springs is now about ten millions of bushels annually. The total yield since they were first worked is set down at over 200,000,000 bushels, exceeding in weight 5,000,000 of tons. Nearly one-half of this amount has been extracted within the last ten years, and the annual yield is constantly increasing. The brines which constitute these springs issue from the rocks of the upper silurian age, and contain from sixteen to seventeen per cent. of solid saline matter.

The waters of these and similarly situated springs are supposed to represent pretty closely the constitution of the ancient oceans, and afford the best clue attainable to the chemical changes which those great bodies of water have undergone since the appearance of continental bodies of land. One of the most noticeable facts connected with the waters at Salina is the large amount of carbonic acid gas which they contain. When they first issue, they are clear and colorless; after a short exposure to the air, they become turbid, deposit a small amount of iron, and soon become permanently clear. The important changes, however, which the silurian rocks have undergone by disintegration and exposure, and the effects of percolation through superior and diverse deposits have very materially lessened the chances of arriving at any very correct conclusions, even from this source, with regard to the original composition of the early oceanic deposits.

THE STATE FAIR opens at Sacramento on Monday evening next. We have already alluded at length, to the extraordinary exertions which have been made to render this exhibition one which shall be worthy of the industrial interests of a great and growing State. We understand everything is in a most forward state of preparation at the Fair building. The California Steam Navigation Company have reduced the price of excursion tickets to the Fair and back to \$6 for the round trip. This arrangement is one which our citizens will no doubt fully appreciate, and will be the means of largely increasing the attendance and consequent usefulness of this forthcoming exhibition of California industry.

molds, adapted to either sandy or adobe lands.

Fig. 1 represents a gang of three plows, with a seed-sower attached to the front of the same, and operated by a crank worked by the front wheel of the gang. Under the seed-sowers are placed springs, which can be readily bent so as to scatter the seed in any desired direction.

Fig. 2 represents a gang of six plows, also with seed-sower attached. One or more of the plows can be taken off, at pleasure, to reduce the draught and width of the furrow, as may be desired. When desirable, an L-shaped harrow, of proper width, can also be attached. One man, with four or six horses, according to the nature of the ground, can work this rig, and when the day's work is over, the land is plowed, sown and harrowed; so that there will be no necessity, as often occurs, when heavy and continuous rains set in, that after the ground has been plowed, a long time must elapse

oughly finished, and furnished in complete running order. The plows are constructed with the greatest lightness compatible with the necessary strength, and are free from braces, or any other obstruction which may collect weeds, or otherwise interfere with the proper working of the gang.

### THE USE OF STEAM POWER.

The proprietors of these plows, being fully persuaded that their construction will admit of the application of steam power to their operation, have, during the past week, purchased a steam engine, with the other necessary appliances, and will immediately institute a series of experiments to test the economy and practicability of the substitution of steam for horses. The result of this experiment will be announced, for the benefit of the public, as soon as it shall have been thoroughly and practically tried. The application of steam to plowing has been made a most complete success in England, and the steam plow there has been

Fig. 1-GANG OF THREE PLOWS WITH SEED-SOWER.

Fig. 2-GANG OF SIX PLOWS.

The steam plow has a grand mission to perform in this State. With the high price of labor ruling here, it will be utterly impossible for our farmers to compete with the cheap labor of Europe and the States of the Mississippi, and place our cereals in those distant markets, unless we can make invention and capital take the place of labor, to a greater or at least as great an extent as there. We must make invention save labor, and so employ our capital as to relieve us, to the greatest possible extent, from any unnecessary excess of that high-priced commodity. The steam plow must be made to join with our cultivators, our reapers, our mowers and our threshers, to increase the dynamic force applicable to agriculture, and liberate, to the greatest possible extent, our high-priced labor for application to those purposes, where intelligence and skill are absolutely necessary.

We shall look with much interest for the result of the experiment undertaken by Webster Brothers, and hope to have more to say upon the subject hereafter. In the meantime, we would advise our planting friends to visit these gentlemen at their warehouse, in Stockton, and examine for themselves this useful and promising contribution of California invention, to the wants of our agricultural industry.

FOR CHINA AND JAPAN.—The magnificent steamship Great Republic, the first of the line especially built for this service, left this port on Tuesday last. She took out a goodly number of cabin passengers, nearly 700 Chinamen in the steerage, and a fair freight of merchandise. A large concourse of people were assembled on the wharf to witness her departure, and cheer after cheer went up as the splendid ship swung round into the stream. The Great Republic is a noble specimen of the great art of steamship construction, and a worthy representative of the important mission in which she is engaged of opening up a new and rapid communication with the Orient and Occident.

THE great tabernacle of the Saints at Salt Lake City is now finished. It is 250 feet wide, and furnishes comfortable sitting room for 10,000 people.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California.

(Continued from Page 114.)

## RAW MATERIALS OF THE EXPOSITION—WOODS AND PRODUCTS OF THE FOREST.

The forest products and industries of nearly every country, are represented in the Exposition, by sections of trees, planks, boards, moldings, etc., and by collections of the tools used for cutting, hewing and sawing.

Of all these collections, that made by France through the "Administrator of the Forests," is the most complete, methodical and interesting. It occupies a space about 60 feet in length, in the second gallery, devoted to group V, and it is very tastefully displayed. Sections of all the principal kinds of trees in the Empire are ranged along the wall with the interspaces filled with green moss. Each section of a tree is about six inches thick, and includes the bark, so that the whole structure and outer form and appearance of the trunk is clearly shown. Above these, on a table which extends around the room, are arranged smaller sections and portions of dressed and worked timber, with herbaria photographs and drawings of forest trees. The tools used are grouped above, on the wall around center pieces, formed of boar's heads. In the center of the room, a broad table sustains various models of forests, and of sawmills, and of apparatus used in felling and transporting timber. We then find also models of the buildings erected for the keeper's lodges, and of cottages for the laborers. Some of the plans in relief, exhibit the important operations of the administration of forests, such as the replanting of the Alps. We find upon the wall a large forest chart of France, which shows in the most striking manner the distribution of the wooded parts of the country, and the relation which exists between them and the geological constitution of the soil. The whole collection is completed by a series of specimens of the various destructive forest insects, with selections of timber ravaged by the fructifications of exotic conifers, which are regarded as naturalized. There is also a series of publications on practical or scientific questions, relating to silviculture, and a fine collection of photographs of cones and foliage of the various pines and firs.

The woodlands of the Empire of France amount to 8,900,000 hectares (a hectare is equal to 2 acres 1 rood 35 perches, divided as follows: 1st, 1,100,000 hectares belonging to the State, of which 49 per cent. is in timber (539,000 hectares); and 51 per cent. in coppice, with or without timber; 2d, 2,000,000 hectares belonging to communes or public establishments, of which 36 per cent. is covered with timber, and 64 per cent. with coppice; 3d, 5,800,000 hectares of private woodlands, 17 per cent. of which is timbered and the remainder in coppice, with or without timber.

The annual products of these forests are in the following proportions, 3 for the State lands, 2.75 for those of the communes, and 2 for those of private owners; giving a gross total of about 20,000,000 cubic meters of timber, divided as follows: Timber and working woods, 2,000,000, and fuel, 18,000,000 cubic meters. These resources are now increasing, in consequence of the numerous improvements in its management of forests, and of the increased facilities for transporting from a distance. The above, and some of the succeeding figures are extracted from an admirable report by De Gaufray, a member of the admission committee of class 41. Notwithstanding, however, all the improvements which have been made and the extensive replanting of the Alps, the Pyrenees, and other districts, the production is still far from sufficient to supply the demands of consumption, and the deficiency is supplied by importations from Norway, Russia, Germany and Italy. The importation of common woods of all kinds, which in 1855 did not amount in value to 70,000,000 of francs, was 154,000,000 in 1865.

One of the largest tree sections—perhaps the largest—is that of a white oak from Auvergne, which is six metres in circumference, a little over six feet in diameter, and 237 years old. The mountains of the Vosges afford sections of firs nearly five feet in diameter, and near them are sections of the pine which has been so successfully planted along the sandy harrens of the sea coast. These trees grow with great rapidity, and annually add one centimeter to their thickness, so that in 100 years they will attain a diameter of about three feet.

## THE FOREST EXHIBITION OF BRAZIL.

Next to the exhibition of the woods of France, that made by Brazil is perhaps the most attractive by its peculiar arrangement. A room 25 feet square, lighted from above, is devoted to these woods alone. The walls and ceiling are painted in imitation of the natural forest. You see around you the plants and trees of the Amazon, with their gorgeous foliage. The spaces between the branches and leaves overhead, are cut out so as to give a subdued light, like that in the deep recesses of the forest.

In the center of this room the specimens of wood are displayed in a grand pyramidal pile. Each tree is shown by a portion of its trunk, of full size and about two feet long. The ends of each are cut in three different directions, so as to show a cross section, an oblique section, and one parallel with the grain. One half of the cut surfaces is polished and varnished. The bark is left on, so that the whole outward appearance of the trunk is preserved. A label is attached to each specimen, giving the common name and the botanical name, according to Endlicher.

## THE FOREST PRODUCTS OF CANADA.

Canada makes a very respectable show of its resources in lumber of various kinds. There are sections of the principal trees, with their bark, in great number. They are usually about two feet long, and are superimposed one upon another, so as to make a base for several columns of square logs, of different economical woods, set up about eight feet apart. These support above a square timber of yellow pine, fifty feet long and ten feet square. The niches formed by this disposition of the timber are filled with smaller specimens, and panels of dressed and polished planks of pine, white wood, walnut and birch. The Abbé Brunet of Quebec, Canada, sends a fine collection of Canadian woods, with herbaria and a series of photographs of trees and of plantations. He makes the whole more complete and instructive by a printed catalogue of 64 pages which contains a large amount of valuable information upon the trees of Canada. The collection, for its uniformity, neatness and pleasing appearance, is one of the most attractive in the Exhibition, and it received the great gold medal.

The woods are shown not only in sections, but in polished planks about two feet long and eighteen inches wide. The most noticeable are the blistered black walnuts and the birdseye maple, the blistered ash and the oak. The following are given as the prices of some of these woods: White pine per cubic foot 12 cents; blistered maple per cubic foot 0.20; blistered ash per cubic foot 0.15; blistered oak per cubic foot 0.30; white cedar per cubic foot 0.15. Most of these trees attain a height of 150 to 160 feet, and vary from four to six feet in diameter.

## OTHER FOREST EXHIBITIONS.

The other colonies of Great Britain, especially the Indies, are well represented by large collections of the woods peculiar to each. In the Australian section, we find an extensive series of logs and polished planks of the Eucalyptus Araucaria, the acacia and others. These woods generally are very hard and dense, and as they might all become naturalized in California, they are practically interesting. The body of information which I have obtained in regard to these woods is so great that I do not attempt to condense it for this letter.

Norway sends a large assortment of worked lumber, such as planks, joists, flooring boards and moldings. There are in this country 3,300 sawmills, which employ 8,000 workmen. In 1865 the exports of lumber amounted to 860,000 tons or 26,800,000 steres\*, valued approximately at 45,600,000 francs. A little more than half of this was saved timber, and this portion was sent chiefly to England and France; the rough lumber is exported to England and Holland. The tongued and grooved stuff 6½ inches by 9-8 thick, is worth one franc and a half per square meter.

Russia exhibits a fine collection of planks and moldings, remarkable for their straight grain and freedom from blemishes. Moldings four inches wide and three-quarters of an inch thick, are sold for one and a half kopeks the English foot.

Among other interesting exhibits of the various forest trees is one made in the

form of hooks all of one size. The bark is solid and shows the bark of the tree. The covers are attached by binges of leather, and open in half, so as to give two shallow boxes, in which are arranged the foliage, the fruit and the flower of the tree, together with the characteristic mosses and lichens of the trunk, and a specimen of the coal.

The name of the plant is printed upon morocco titles, which are attached in recesses cut in the bark of the back. This is one of the most pleasing methods of preparing and preserving a collection of native woods, and this notice may induce some of our amateurs to undertake the preparation of a similar collection for California, at some future exhibition.

The Grand Duchy of Finland sends a very interesting collection of woods, with a descriptive catalogue, from which much valuable information may be obtained.

## THE UNITED STATES POORLY REPRESENTED.

In the midst of all these extensive and careful representations of the forest resources of the various countries, the citizen of the United States is mortified at the meagerness of our exhibition in the same line. All that we have to show of our vast forests, full of the choicest timber, may be laid upon a table ten feet long, and three wide. There are two bundles of very good shingles from the far west, a few irregular bits of American wood, and the laurel panels and door from Boyd of California. These last are very beautiful, but do not appear to have attracted the attention they deserve. I certainly have not seen a polished door in the Exhibition equal to ours, either in accuracy of carpentry or for beauty of grain.

It is very unfortunate that a section of our great trees could not have been sent here as proposed. I have seen parties of visitors stop to admire the dimensions of some of the four and six foot sections. What would they have said before one five times the size! The specimens of planks of our commercial wood promised for the Exhibition, never came to hand, and I presume were not prepared in time.

Some facts about cork, tanning barks, resins and other forest products, must be reserved for my next letter.

\*A stere consists of 353,174 feet.

[From our Traveling Correspondent.]

## Mining in Placer County.

## A RICH MINE NEAR AUBURN.

Quartz appears to be the rage at present in the vicinity of Auburn. The most exciting development is that of the "Pete Walters." This ledge was located some two years ago, but no free metal was discovered until the Fourth of July last, when, at the depth of twenty-eight feet, it was found to be exceedingly rich in free gold. Mr. Walters has since sunk two more shafts, making three in all—the first, 28; the second, 35; and the third and last, 48 feet in depth. The ore gradually becomes richer, until at the bottom of the richest shaft it is apparently one-third gold! A drift is being run to connect the three shafts—the whole covering a line of about 150 feet on the ledge. Mr. W. has taken out about \$30,000, up to August 1st. One day's work yielded him as high as 450 ounces. His laboring force consists of only four men, while his mechanical and machine power is still less, viz: a 1-stamp battery, or, in other words, a hand mortar. Said ledge is about eighteen inches in width, and bids fair to continue rich. Col. Holdredge, backed by prominent Eastern capitalists, is prospecting a number of ledges, said to promise well. The Colonel is sanguine of success, feeling confident that Auburn and vicinity abounds in good pay ore.

## BATH—THE DEWEY CLAIM.

This place is comparatively lively, owing to the continued and constantly increasing success of the Dewey claim (Paragon Mill Co.) owned by Messrs. Rae, Wheeler, Freeman & Breece. This mine consists of a deep strata of cement, one hundred feet above the bed rock, and running into the Forest Hill divide nearly at right angles with Volcano Cañon. Their main tunnel now extends, in a direct line, a distance of 2,400 feet, with a sufficient "breast" to employ their 20-stamp mill a period of five years. They employ a force of fifty hands, taking out sufficient pay dirt in ten hours to supply the mill twenty-four. The average yield is about five dollars per ton,

crushing at the rate of 100 tons in 24 hours, and cleaning up upwards of 150 ozs. per week. The gold nets them a trifle over \$18 per oz., clear of expressage and Federal tax. The dirt is growing richer as they progress; as evidence of this, their last clean up (August 1st) amounted to 186 ozs. The proprietors are all workers, and every way worthy of the rich harvest they are now reaping.

## LAST CHANCE.

Drift mining is being pushed with considerable vigor in this place. The Little Hope Co. are in about 1,000 feet in solid bed rock, expecting to strike the lead every day. Messrs. Young & Co., of Morning Star mine, are doing well, realizing \$12 to the man.

## DAMASCUS—THE MOUNTAIN GATE CLAIM.

This is a lively little place, made so by kindness of disposition and temperate habits of its citizens; financially, by their inexhaustible and even-paying mine, styled the Mountain Gate claim. This mine is owned by 21 shareholders, all workers, each realizing liberally in proportion to his labor. The claim is opened by a tunnel nearly a mile long in a direct line, and is paying uniformly—never realizing anything less than good round wages—\$6 and upwards to the man. Messrs. Powers, Hughes, Devley, and Cameron, are among the principal owners. The Damascus Mill Co. (Messrs. Rae & Fagan, proprietors, and Robert Lewis, superintendent) have an excellent 10-stamp mill, and fair prospects for good paying cement as soon as their mine is properly opened up. They are confident of striking it rich.

## IOWA HILL.

The Morning Star Mill Company (Dodds, Mitchell & Co.) are crushing some extraordinarily rich cement, demonstrating that they have a lead unsurpassed in Placer county. Also the Jamison-Weisler hydraulic claim, having, unlike their neighbor, plenty of water, are taking out "big money." Evidences are that the future promises well for this locality.

## GOLD RUN

Presents a lively appearance. About one-third of the claims (hydraulic) are now being worked, all paying well; yet, it is believed, they do not save near all the gold, which, by the way, is very fine and mixed with such immense mountains of wash gravel as to entirely preclude the application of any improved machinery in washing. The mines here are "piped" off to the depth of from one to two hundred feet, when the gravel and pipe clay becomes so hard as to prevent further working at present rates of water and labor. Far beneath, say from 100 to 150 feet, is supposed to exist a "blue lead," extending from Indiana Hill through Gold Run to a point a little below Dutch Flat, at which two termini it has been found, and now being crushed.

Indiana Hill Mill Co. (Messrs. Stone & Co., proprietors) are working the lower end of this lead successfully. Their mill is small and they have but few hands employed, intending to enlarge as soon as their mine is sufficiently opened up. Portions of the pay strata is very rich, the writer having witnessed the washing of one pan of dirt, which yielded about \$40. Messrs. Kinder, Carr, Taylor & Co., talk of uniting their efforts and means, procure machinery and sink a shaft at some intermediate point yet to be designated, for the purpose of prospecting the channel underneath their hydraulic claims, for cement. The project is a good one, and commendably spoken of by the citizens generally.

## DUTCH FLAT.

At this season of the year, is considered rather dull—want of water being the cause. There are many rich claims yet to be worked. Messrs. King Bros., it is said, are doing a handsome business, crushing cement—don't want to sell—presumption is, they have "struck it." Messrs. Strong, Frink and others, have organized a company, styled the "Dozier Metallurgic Co.," formed for the purpose of making an immediate test, and upon a large scale, of Dr. Dozier's invention, a chemical and mechanical process for reducing refractory ores—something entirely new—and if successful in working large as well as it does small quantities, it will make valuable many mines now considered worthless, or comparatively so, at least. The company has employed Dr. D. (who is already at work) to make a thorough practical test on their mine (Camanche ledge) in Mono county. They claim to work to within five per cent. of the fire assay, and at a cost not to exceed \$20 per ton. The writer was shown a \$40 brick, made from thirty-one pounds of Camanche ore, by this process. Mr. Frink has kindly offered to keep the Press posted with experimental results as they are made. B.

## Mechanical.

## The Angle of 60°.

In forming the cutting angle of tools, as used by the iron worker, no very definite instructions are given. The apprentice copies as near as he can from the master or the more experienced workman, and they work in the manner in which they were taught. Every mechanic has at times observed that there was a certain angle which, when given to the cutting lines of tools, was more effective and resisted the action of the material in which the tools operated better than others; but with the exception of an effort to remember these lines by the eye, he has no gauge or guide to assist him in the production of the same angle again.

It is generally acknowledged that the cutting angle of a lathe-turning tool operates best, is the most effective, and has the greatest strength, when formed with an angle of about 60°; and this same angle, which in tools of this kind may be called the *angle of strength*, can be formed to advantage in all tools which are used to operate in iron or steel.

The angle of 60° is easily formed and as easily remembered. To obtain the proper proportions, inscribe a circle, and in this circle draw an equilateral triangle, the points of which intersect the diameter of the circle, and this angle has 60°, and has been found by experience to be the strongest and most durable form that can be given to an iron-cutting tool. If the reverse of this angle, or an indented V of the same form, be made in a piece of metal, it will form a gauge or guide by which to form the cutting edges of nearly all the tools of the iron worker.

We have mentioned the lathe-turning tool as an instance of the efficacy of this angle. The chipping or cold chisel is another example, and there is no tool the edge of which is subjected to a greater amount of rough usage and strain, and more liable to give way, than this simple tool; but if its cutting angle be formed to lines which meet at an angle of 60°, it will be found to stand more blows and wear longer than at any other angle. For delicate work a more acute angle may be used, but for ordinary purposes this angle will be found the most serviceable.

The same angle can be used in the cutting angle of the flat and twist drill, but there is a greater efficiency in the twist drill over the flat one, and for the reason that the angle is more acutely presented to the work than in the flat drill. The counter-bore or pin drill and the chasers employed to form screw-threads, are examples in which this angle could be advantageously used, giving the tools greater strength and durability. In some of these tools the angle is differently presented to the work than in others, yet the same number of degrees may form the lines of the cutting edges. \* \* \*

The teeth of mills, reamers, and circular saws for cutting metals operate as a series of revolving chisels, removing whatever metal they come in contact with, and to get the greatest strength and maximum of wear their teeth must be formed with the angles as we have explained. When these tools, thus made, are used in the heaviest work, they will seldom break or give way with any kind of fair usage; but if they be made with a more acute angle will break or crumple, and if with a less angle will not operate as easily nor as effectively.

The lathe centers are best made when shaped at the angle of 60°, and, in fact, this angle has been recognized as a standard for their formation in many shops, while in others we see no attention paid to it, and the centers are made by "guess," but it has been ascertained that the angle of 60° stands the best under all kinds of usage, and the same gauge by which they are shaped can be used to form the rose-head or countersink which is used to form the center in shafting and work to be turned, and it will then accurately fit the center of the lathe.

This angle of 60°, as an example of strength and service, can enter into the formation of nearly all of the cutting tools used by the machinist or iron-worker, and a simple gauge, made of sheet steel, will be found a sufficient guide to enable the mechanic to obtain it without any difficulty.—*American Artisan*.

**STEEL VS. IRON FOR RAILROADS.**—The steel rail mania grows apace both in Europe and America. American engineers, although they can soon get all they need of the Bessemer rails manufactured here from our superior ores, are still very naturally seeking information in England by inquiry, experiment, comparison, etc. The *London Railway News* mentions a steel rail, now to be seen still in use at the Chalk Farm Station of the London and North-western road, which has outlasted *twenty-five* iron rails successively placed next to it on the same line. The toughness of the steel rails has lately been made the subject of experiments by a large manufacturing house of Sheffield, for the satisfaction of a well known American railroad engineer. The dropping of a ram of a ton's weight from a height of twenty feet upon one of these rails, supported on iron blocks three feet apart in the clear, resulted in only slightly bending it; and the repetition of the blow on the other side of the rail, from a height of thirty feet, merely straightened it, and so homogeneous was the composition of the rail that not a crack was visible. Such toughness and durability must before long force iron aside for the substitution of steel, as the difference in price is saved over and over again by the lasting qualities of the more expensive article. Penuriousness is never economy.

**A STEEL SIGNAL BELL.**—The *Territorial Enterprise* has examined, at the Imperial mine, a steel signal bell, manufactured by Mr. John Holden, blacksmith of the mine, which that paper claims as a credit to the mechanical skill of Washoe workers in iron and steel. The bell is of a larger size than could easily be procured on the coast, being fifteen inches in diameter, and was made by Mr. Holden from a large plate of steel brought from San Francisco for the express purpose. The tone of the bell is much finer than that of the common bronze signal bells. The bell will be put up at the new shaft.

**A CHEAP GLASS CUTTER.**—Take an old three-cornered file, heat it red hot, and plunge it into a previously prepared mixture of equal parts of ice and salt, stirring it about so as to cool it as quickly as possible. Then grind the point on a wet stone, preserving the three sides as nearly as possible, and it is ready for use. Lay the glass to be cut on a perfectly smooth surface, apply a thin flexible rule, and draw the point of the file quickly over the glass. A little practice will teach one how hard to bear on without fracturing the glass. To insure success it is needful to notch the edges of the glass at the extremities of the scratch. The file can be reground when it becomes dull. Such an instrument will be found serviceable for cutting glass for windows, and all ordinary purposes.

The leather washers under the heads of carpet tacks are cut and placed by a simple machine operated by the foot. An upright punch comes down on a die and cuts the leather, while another punch, working inside the first, drives the tack through the leather. The tacks are placed in a hopper, from which a tube, split through the bottom, conducts the tacks to the press, the points hanging through the slot, the tacks being suspended by their heads. The best tacks for carpet purposes are those made from tough iron usually labeled "Swedish iron."

**A NEW ALLOY,** consisting of sixty-five parts tin, eight parts copper, ten parts lead, and seventeen parts antimony, has been patented in England. The composition is particularly designed by the inventor for facing or forming calico printing rollers. In this country, these rollers have been always made of composition brass or bronze, or preferably of copper, cast, drawn and rolled directly from the ingot.

The New Haven building-block company are manufacturing patent brick having a long narrow slit, or air-chamber, which they claim will keep buildings constructed therewith cooler in summer and warmer in winter than when built with ordinary brick. The bricks are made of a mixture of cement and shell lime.

The New Bedford glass company has recently begun to manufacture porcelain glass for photographic plates. They are blown in hollow cylinders four feet long, cut longitudinally, flattened in a furnace and cut into plates of the required size.

The Erie railway machine shops at Dunkirk, have just completed two locomotives for that road, which are constructed with the water tanks around the upper portion of the boiler. The tender is thus left entirely for the use of fuel.

## Scientific Miscellany.

**CAUSE OF THE VARIATION OF THE MAGNETIC NEEDLE.**—V. Raulin, of Bordeaux, France, has recently published a work of ninety-two pages, giving a large number of observations, showing the periodical variations of the magnetic needle in all parts of the earth. He explains them by supposing that a body of greater density than the molten interior of the earth, more or less irregular in form, and having the properties of a magnet, forms part of the earth's interior mass; but is not attached to the internal crust. A line connecting the poles of this magnetic mass would correspond in direction with a line connecting the actual magnetic poles of the earth. A mass so suspended, in a semi-fluid medium, could not keep fully up with the earth in her daily revolution, but would fall gradually behind. The calculations of Raulin are, that this mass actually loses one revolution in 600 years, during which time the magnetic variations upon the earth form their cycle. A similar hypothesis to the above was proposed in the *American Journal of Science*, by the late Chancellor Lathrop, in 1840.

**REMARKABLE SPECIMENS OF CARBON.**—Some very remarkable specimens of indurated anthracite carbon were recently presented to the Academy of Sciences, at Paris, by M. Dumas, in the name of Douhet. They are supposed to have come from Brazil; but their origin and mode of occurrence is not known. They were in the form of small nodules, made up of irregular concentric layers. They took a surprising luster when polished. Color, black, like anthracite, with a density of 1.66. Even the thinnest fragment was opaque. Their composition was the same as anthracite, with the ash varying from four to eleven per cent. Though fragile and brittle, the fragments were found to scratch not only the hardest gems, but also the diamond itself—though ordinary anthracite will not scratch even glass.

At the recent session of the Academy, Dumas read a note from Méne, calling attention to some specimens of carbon presenting a similar appearance, which he had obtained, artificially, by heating anthracite for a long time in a muffle. The anthracite thus acquired a metallic luster, steel-gray color, and scratched glass and steel with the cry of the diamond. Its density was 1.63. The coal used was from Creuzot. The coke produced from a mixture of the Creuzot anthracite with the St. Etienne bituminous coals contained a multitude of brilliant points, which scratch glass.

**CHANGES OF STAR COLORS.**—One of the most important phenomena presented for the study of modern astronomers is the important changes which are taking place in the colors of the stars. Heretofore the great difficulty to progress in this direction has been the want of a standard of reference, by which astronomers could measure and verify their observations, and set them down for future reference and comparison. Mr. Kincaid has recently devised an instrument, which is said to meet this difficulty quite fully. He calls it a "metrochrome." It contains a rotating drum, with six equidistant apertures; three of these transmit the normal light of the lantern, and the remaining three are constructed so as to admit flat-sided hottles containing differently colored chemical solutions. By wholly or partially covering one or more of the latter apertures and giving a rapid rotation to the drum, it will be possible to produce a light, which, thrown into the telescope, forms the image of an artificial star. This may be varied until it exactly resembles the light of the star under examination. It has been proposed to insert colored glasses or precious stones in the rotating drum. Mr. Kincaid, however, prefers the use of chemical solutions.

**SPONTANEOUS COMBUSTION.**—Mr. Trevor Clarke publishes some facts explanatory of the unknown causes of sudden fires and explosions in fireworks factories. He remarks that chloride of potash is the most dangerous substance used in the business. Not only will it, when mixed with other substances, sometimes ignite by a shock, but even go over into spontaneous combustion without any apparent cause. A mixture of nitrate of baryta or strontia, sulphur and chlorate of potash, so often used in preparing green and red lights for theaters, etc., may inflame spontaneously when made from recently well-dried substances, and will surely take fire in a few hours when placed in a moist locality. Clarke witnessed such spontaneous combustion. First, a yellow gas was developed, then the mass melted in several places, a hissing sound was heard, more gas developed, and soon the whole mass was in a blaze of fire. The same was observed when black oxide of copper was introduced in the mixture to make a purple fire. The addition of small quantities of sulphuretted antimony prevent the ignition of mixtures containing chlorate of potash. Carbon possesses the same quality of preventing such combustion, but not to so reliable a degree. But any of these mixtures will ignite when moist and drying them at a temperature slightly too much elevated.

**TO DISCHARGE THE STAINS OF** nitrate of silver or ordinary marking ink. This may be done easily by several agents. Chloride of lime in strong solution is a convenient and ready article, that converts the silver to a white chloride, which may then be removed by washing with ammonia, or a solution of hyposulphite of soda. If the stain be of long standing, it may be necessary to repeat this process several times before it will be effectually discharged. Cyanide of potassium is excellent for decomposing the nitrate of silver, and will readily remove stains or marking. The cyanide of silver which has been formed, is easily dissolved in an excess of cyanide of potassium. Tincture of iodine is sometimes recommended; it is designed to produce the iodide of silver, which may be washed away by using the hyposulphite of soda; this method, however, is not to be relied on; it does not always succeed.—*Druggist's Circular*.

**THE BED OF THE OCEAN.**—It is stated that soundings have been made in the North Atlantic to so great an extent that it is now possible to map out its bed quite accurately. This ocean is a long trough of varying depth, extending, probably, from pole to pole. Its bed follows the general structure of the land. Here and there rocky peaks, like that of Teneriffe, or huge mountains of sand, such as the Grand Banks of Newfoundland, reach up to or beyond the surface. Between Ireland and Newfoundland there exists a remarkable plain, known as the telegraphic plateau, which is evidently a continuation of the great watershed which, between latitudes 40 deg. north and south, surrounds the earth, and divides the waters flowing north from those flowing south.

**THE SOURING OF MILK.**—Housewives that depend upon milkmen for their daily supply of the lactical fluid, sometimes find that, despite the best of care, the milk will sour much sooner than it ordinarily does. Neither they nor the milkman can explain the cause. Probably the following item may do so: "By experiments at Elgin, Illinois, it has been proved that the milk of an irritated cow soon gets sour; that added to the milk of quiet cows, it quickly soures the whole, and that it makes inferior butter."

**MAN AND BRUTE.**—The great distinctive feature between man and the highest order of the brute creation is the faculty in man of making himself and his mental condition a distinct subject of thought. On this faculty depends other important peculiarities, viz.: the capability of indefinite progress, the idea of morality, the notion of a future state, and the power of language.

**DENSITY OF OZONE.**—It has been determined, by Soret, of Geneva, that the density of ozone is one and a half times that of oxygen, or 1.657, if air be taken as one. While, therefore, the molecule of free oxygen contains two atoms, that of ozone contains three.

The American Association for the Advancement of Science commenced its annual session for 1867 at Burlington, Vt., on the 31st ult. Prof. J. S. Newberry is President for the year, and Dr. Walcott Gibbs, Vice President. An interesting and instructive session is expected.

## Our Industrial Progress.

No spot on earth possesses, in a greater or more varied extent, the elements of agricultural and manufacturing wealth than California. Our teeming soil produces, in the greatest luxuriance, corn, wheat, barley, tobacco, hemp, flax, etc. More than 300 varieties of grapes, from many millions of vines, mature their annual products in perfection and profusion nowhere else excelled. Our mineral wealth, in variety and abundance, is the wonder and astonishment of the world. We already gather a wool product from more than two millions of sheep, with an annual increase of stock and improvement of breed, which promises ere long to place us at the very head of wool growing countries. Our numerous rivers, by their profusion of water and rapid descent, seem to invite the millwright, with his cunning art, to turn the immensity of their watery powers to profitable account. Within a little more than a single decade we have raised ourselves from absolute dependence upon foreign countries for the very necessities of life, not only to independence, but to a point where we are now able to send millions upon millions of our surplus grain to every quarter of the civilized world. We have now between one and two hundred flour mills in operation, with their numbers constantly increasing; scores of foundries to furnish machinery, not only for our own supply, but also for the use of countries to the north and south of us, to the islands of the Pacific, and to the opposite coast of Asia. We are also furnishing our own manufactured sugar, our own cordage, our own chemicals, our own powder, and, to a great extent, our woollens, our boots and shoes, our cottons and tweeds, our printing and wrapping paper, and hundreds of minor articles too numerous to mention; but all of which enter, more or less, into our daily consumption, and for which we have, until quite recently, been dependent upon Eastern or foreign manufacturers. Of a verity, California is rapidly becoming a manufacturing, as well as an agricultural and mineral producing State!

The teachings of true political economy, which have been sadly neglected by many peoples, who have for centuries struggled for a bare existence among the nations, have been better understood and more readily received by the legislators and capitalists of the rising Empire of the Pacific. The ruinous course of importing the necessities of life, instead of producing them at home, and of sending abroad our raw materials, to be returned again at a two and three-fold increase of value by foreign labor, instead of manufacturing them at home, was early foreseen and guarded against by our people. We are already beginning to reap the rich reward of such foresight. Even the extraordinary high prices of labor and money, which have necessarily prevailed here, though strongly militating against such a policy, has nevertheless failed to daunt or discourage those who have determined to lay aright the foundations of a State which is destined to rise on these Pacific shores, with a rapidity and might no where else excelled in the history of the whole world.

We have been led into these reflections by some hasty visits the past few weeks, to some of the prominent manufacturing establishments which have recently gone up in our midst, and whose progress and importance we propose to illustrate in a few brief articles from time to time, as space and opportunity shall present. The first article of the series appears in another column to-day.

**WOODWARD'S GARDENS STILL AHEAD.**—In addition to the many other attractions afforded in the way of amusement and instruction at this delightful place of resort, it will be seen that a grand instrumental concert is given every Saturday afternoon, and on Sundays a concert of sacred music appropriate to the occasion.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

67,445.—FURNACE FOR ROASTING ORES.—David Jones O'Hara and Clark Brown Thompson, Empire City, Nev.:

We claim, 1st, The combination and arrangement of the hinged circular plate, E, E', with the inclined oblique hoes, a, a, a, a, all constructed as shown, and attached to the endless chain, D, substantially as and for the purpose specified.

2d, The arrangement of a series of fire-chambers, G, G, along the sides of the ore chamber of a desulphurizing furnace, at intervals of about twenty-five feet, substantially in the manner and for the purpose set forth.

67,483.—GANG PLOW.—Robert Baxter, French Camp, Cal.:

I claim the head-piece or flange, in combination with and forming part of the standard, in the manner and for the purpose set forth.

67,512.—MACHINE FOR FERMENTING LIQUIDS FOR DISTILLATION AND OTHER PURPOSES.—R. De Heuruse, San Francisco, Cal.:

I claim the introduction of air of the proper temperature and moisture, and in the proper quantity, into the fermenting substance from below, for the purpose of more thoroughly fermenting the whole mass, and to control the progress of fermentation, substantially in the manner described and set forth.

## RECENT INVENTIONS.

**MCCARTY'S IMPROVED NEWSPAPER FILE.** Mr. L. P. McCarty, of this city, has submitted to our inspection a newspaper file, constructed simply of stout wire. It is cheap, durable, readily managed and not easily broken or thrown out of order. The sheets are firmly held in chronological order, and by its use there is no necessity of punching holes through the paper, as is usually required in newspaper files. A piece of wire of any desired size, having a loop at one end, is doubled upon itself, by means of a coil or coils in its center, these coils when the wire is doubled over, forming the upper end of the file. The end brought down thus, acts as a lever, and has at its lower extremity a hook or catch, which clasps the under rod. By this means a file is formed which will hold any number of papers, by having the pressure evenly distributed the entire length of the paper. The file being easily operated, and not liable to get out of order, seems to be much more convenient and desirable than any newspaper file with which we have met. Application for a patent for the same has been made through the patent agency connected with this office.

**A NEW CONCENTRATOR.**—The *Enterprise* says that a new machine for concentrating tailings has been invented and tested by a miner at Virginia City, named Holden. It has been put in operation at the Ophir mill and bids fair to prove a success. The tailings concentrated by the new apparatus yield about \$200 per ton. Mr. Holden is also the inventor of an improved safety hook, a patent for which has been applied for.

**HYDRAULIC GOLD GLEANER.**—Charles Schofield, of Havilah, Kern county, has invented what he calls a hydraulic gold gleaner, which is described as follows by the *Courier* of that place: "The crushed rock is conveyed through sluices into a box with a sieve for a bottom. About six inches below this is another box, the bottom of which is lined with quicksilver. Water is conveyed from any desired height by means of a pipe, and flows up through the sieve. This action of the water carries off all the light gravel, etc., while the gold, sulphurets, etc., resist the action of the water, and fall through the sieve into the lower box containing quicksilver, where any desired number of faucets are affixed, with which to regulate the current of water flowing up through the sieve, and at the same time to draw off the sulphurets. One of these is now in operation at Bibler's mill, near this place. The inventor offers \$100 per ounce for all the gold which may be extracted from the tailings of this machine."

**BIG GUNS.**—According to the *Army and Navy Chronicle*, 25-inch guns, burning 275 pounds of powder, are to be the artillery of the future.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
September 7, 1887.  
City Stocks.

The open sales of city stocks continue on a small scale, and during the past week have been restricted to a few companies; however, a better feeling is expected to prevail in the course of a month or so, when, as usual during the fall months, the interest in mining stocks will be less active, and more consideration will be given to other investments. Considerable sales of San Francisco Gas stock were made at \$66 50@67 per share. The usual monthly dividend of ½ per cent. on their capital stock, amounting to \$30,000, has been payable since the 2d instant. California Steam Navigation Co. is in slight request, a few shares selling at 71 ½ per cent. The stockholders of the California Building and Loan Society will hold their annual meeting for the election of Directors for the ensuing year on Tuesday, September 10th.

Legal Tenders have been selling at 71 ½@71 ¾ cents. The sales in the Stock and Exchange Board in the month of August for the past four years compare as follows:

August, 1884.....	\$ 633,063	August, 1886.....	\$1,234,452
August, 1885.....	4,232,518	August, 1887.....	7,538,420

It will be noticed that the business of the Board has been vastly augmented in August of the present year as compared with former like periods. The nearest approach to the transactions of last month was in May, 1865, when the sales amounted to \$5,655,549.

## Mining Share Market.

Since our last reference a general degree of activity manifested itself throughout the whole list, and the intervention of the election for State and municipal officers, though one of the most exciting contests ever experienced in this city and State, has had no very marked effect in decreasing the dealings. For the most part, however, prices have declined from our previous quotations, owing principally to "bear" operations upon several leading stocks. Several companies have already announced their dividends for the present month, and most of the other companies usually embraced in this list will follow next week. The bullion product of the Comstock Lode, for the month of August, from present information, will not be as large as in July. Most of the companies performed a large amount of dead work, frequently occurring in all mines, which may be assigned as one reason for the lessened production; while others have been engaged in sinking new shafts and placing hoisting machinery, etc., together with preparatory work for the coming winter. This extensive argentiferous lode needs only further development to prove its great value, and it is to be regretted that operations upon that much needed work, the Sutro Tunnel, were not commenced at the agreed time. This delay has already induced the Savage company to withdraw from its stipulated contract, and other companies take little interest at present in the enterprise. That this great work will be accomplished no one will question, but it should be done as speedily as possible, so as to avoid the enormous outlay of money which is at present required to extract the precious metals.

Yesterday the Board inaugurated open or informal sessions, the morning session continuing from 10 ½ to 10 ¾ o'clock, and the afternoon session from 2 ¼ to 2 ½ o'clock. The regular sessions will be held as follows: Morning, from 11 to 12 o'clock; afternoon, from 3 to 3 ½ o'clock—as formerly. The difference between the open and regular sessions is that at the former the public are admitted and can bid through their broker only, while at the latter none but members can participate. The same rates will be charged at the informal session as at the regular Board.

**HALL & NORCROSS**—has again made its appearance in the market, one foot selling on the 3d inst. at \$2,500 seller 60, and on the 5th two feet were disposed of at \$2,400 seller 60, and \$2,350 seller 30, respectively, and at close selling at \$1,900 seller 30. We learn that during the month of August 3,117 tons of ore were reduced by custom mills for this company, showing a 65 per cent. assay yield of \$121,578 in bullion, which is equal to a fraction over \$39 per ton. It is believed that the returns from the mills will fully come up to the contract requirements. During the month of July the 65 per cent. product of 3,278 tons of ore amounted to \$133,905, or \$40 85 per ton.

**SAVAGE**—was dealt in to a very large extent, under a strong effort to bear the stock, and the large amount upon the market produced a recession early in the week, when it fell from \$205 to \$190 seller 30, advanced to \$215, then sold at \$206, and closed yesterday at \$195. We are informed that the average width of the ore opened on the Potosi body, on the two floors of the seventh level, is from eight to ten feet, and that its length had not yet been ascertained. The water has now been nearly drained from the north winze on the seventh level, and work will soon be resumed at that point. In the south mine the drift from the third level has been connected with the main south winze, and is reported to be in good ore. The bottom of the winze sunk from the third to the fourth level, which is now fifty feet in depth, is entirely in ore, and a cross-cut westward has developed six feet more, said to average \$75 to the ton. During the week ending August 31st, 2,095 tons of ore were taken from the mine, showing an approximate yield of \$81,382, equal to \$38 84 per ton. Of this amount the north mine yielded 1,175 tons and the middle mine 747 tons. The receipts of bullion will be fully as large as in July; the exact returns have not yet been received at the office in this city. A dividend of \$12 50 per share will be disbursed to the stockholders on Monday, the 9th inst., and a cash surplus of from \$70,000 to \$80,000 will be carried to the account of the present month.

**KENTUCK**—is in much less favor, rapidly declining from \$305 to \$228, then selling at \$260, and closing yesterday at \$240. The bullion obtained from 2,657 ½ tons of ore reduced during the month of August, amounted to \$104,215 against \$125,767 in July, showing a yield of \$39 21 to the ton, and deducting all the expenses, which

are given at \$24 65 per ton, produces a net profit of \$14 56 per ton. The quality of the ore is not so good as that extracted in the month of July. We are indebted to the Secretary for the following abstract of the monthly statement:

RECEIPTS.	
Balance on hand, July 31st.....	\$ 95,571 75
Bullion in August.....	104,215 35
	\$200,787 11
DISBURSEMENTS.	
Dividend.....	\$50,000 00
Outstanding 2,657 ½ tons of ore.....	38,861 80
Labor account.....	10,575 00
Timbers—212,623 feet.....	6,378 59
Wood—51 ½ cords.....	774 87
Discount on bars and assay expenses.....	3,251 70
Taxes.....	2,749 60
Legal expenses.....	3,339 53
Office expenses.....	1,073 35
Other expenses.....	1,217 66
	149,222 00
Balance.....	\$51,721 11

The expenses were considerably larger than during the month of August. This additional sum was mainly required for quarterly taxes, supplies, etc. A dividend of \$25 per share will be paid on and after to-day.

**CROWN POINT**—met with considerable inquiry at fluctuating rates, declining from \$950 per foot to \$855, advancing to \$1,000, receding to \$950, and closing at \$950. The winze from the 600-foot level is sixty-one feet in depth, and in drifting east from it eighteen feet, passed through changeable ground, the first five feet penetrating small strata of pay ore mixed with quartz, the next four feet running in porphyry, then encountered another narrow pay streak of ore, said to average \$70 to the ton, and the rest of the drift continued through small seams of ore, all dipping to the west. The face of the winze contains considerable porphyry. The south winze on the 600-foot level is down some fifteen feet, and is said to be improving. Three winzes have been sunk from the 500-foot level, and the ore in them is so hard as to require blasting to extract it. Below the 500-foot level, south, the ore is reported to be very good; north, not so good—little more than covers expenses. The average daily product is about 70 tons.

**IMPERIAL**—has been in decided request at enhanced rates, improving from \$142 50 to \$160, receding to \$142 seller 3, and closing at \$146. On the 30th ult. a fair body of ore was discovered on the 371-foot level, and thirty feet north of the south line they drifted into the ore about fifteen feet without reaching the east or clay wall. It is believed that this ore extends to the 230 foot level above, and that from 3,000 to 4,000 tons of a good average quality will be obtained from this point. The other levels are producing the usual amount of ore. In August \$89,280 in bullion was shipped to the office in this city against \$99,627 in July.

**OVERMAN**—has been comparatively quiet, selling at \$67 @72 50, receding to \$52 50, and closing yesterday at \$63. On the 400-foot level they are drifting towards the Mary Ann ground, with the expectation of finding a body of ore which was left in early days, and believed to be worth about \$30 to the ton. At present they extract sufficient ore to supply one mill, its reduction capacity being about twenty-three tons per day, and the product slightly in excess of expenses. On the 2d inst. \$2,500 in bullion was shipped to the office in this city.

**CHOLLAR-POYER**—commands the attention of numerous buyers at enhanced rates, selling early in the week at \$415@425, receding to \$405, improving to \$442 50, and closing at \$430. During the week ending August 30th, the shaft has been sunk and timbered fourteen feet, requiring a further depth of twenty-five feet to reach the fourth station, which will be 911 feet from the surface. In the Peck drift, on the second level, they are taking considerable ore from a point forty feet above the track floor. A better quality of ore is said to be obtained from the old Santa Fe level; otherwise, the old works show no material change. It is said the new shaft carries clay at the bottom, and may give trouble in timbering. The bullion returns for the month of August will be upwards of \$340,000; in July the receipts amounted to \$311,581.

**CONFIDENCE**—has been dull of sale, realizing \$70@67. It will probably take some two weeks to ascertain the existence of ore in the west drift on the 365-foot level. More ore will be taken from the fourth level than was expected. On the third floor they followed a narrow streak of quartz and found a good quality of ore, said to be some eight feet wider than the regular ledge. The bullion yield in August amounted to \$12,304 17 against \$16,527 52 in July.

**GOLD HILL QUARTZ**—is also dull at a decline, selling early in the week at \$100 per share. The receipts of bullion in August aggregated \$9,771 52, while in July the yield was \$10,250 57. Deducting all expenses, a balance of \$5,200 remains in the treasury. No dividend will be disbursed during the present month.

**ORFEM**—receded from \$110 to \$85, then sold at \$90@85. The new shaft had reached a depth of fifty-two feet on the 4th inst.—being at the rate of five feet a day since they commenced it.

**YELLOW JACKER**—declined from \$650 to \$540, rallied to \$600, then sold at \$570@590, and closed at \$572 50. We have it from a reliable source, that this company is at present reducing \$12 ore, and that the present month will show a deficit of at least \$40,000. The bullion product of July and August we have been unable to obtain, and after diligent inquiry in various quarters, we can give no information whatever in regard to the present condition of the mine.

**DANEX**—levied an assessment of \$1 50 per share, or \$6 per foot, on the 2d inst.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,507,493.

We give on another page, a tabulated statement of the fluctuations of the principal mining shares on this coast for the past six months. We are indebted for the figures to Mr. J. H. Carmany, editor of the *Weekly Stock Circular*. We shall continue the publication of this table monthly hereafter, instead of our weekly publication of the sales at the stock board.

Fluctuations in Leading Mining Shares for the past Six Months.

Table with columns for Bank of Company, March 9th, March 20th, March 30th, April 10th, April 20th, April 30th, May 10th, May 20th, May 30th, June 10th, June 20th, June 30th, July 10th, July 20th, July 30th, Aug. 10th, Aug. 20th, and Aug. 30th. Lists various mining companies and their share prices.

AN INSTRUCTIVE BOOK!

Prof. LAYRES' ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY. For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address. Price, postage paid, \$1.10

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Table listing mining companies, their locations, and dates of dividends or meetings. Includes companies like Gould & Curry, Ophir, and various Nevada and California mines.

San Francisco Market Rates.

Table of market rates for various commodities including flour, wheat, corn, and other goods. Includes sub-sections for Wholesale Prices and Retail Prices.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 6, 1867. We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

Table showing prices for various types of copper ores, such as 12 per cent. ore, 13 per cent. ore, etc., with prices per ton.

San Francisco Metal Market.

Table listing prices for various metals and alloys, including iron, steel, and copper. Includes sub-sections for Jobbing prices and Prices for Invoicers.

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. Layres (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetic and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS: It is simple, concise, and well arranged. It seems to be a work of great value.—John Siedel.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one of the kind possessing the advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—Wm. H. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Dorman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Win. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Bryson.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boies.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. He knows of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. E. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 68 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alto California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste, than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in medias res." He aizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you, either he pieces before your eyes—or rather, he should say, neatly and skillfully dissects it—dislays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

E. L. SMITH, Secretary of Montana Territory, has become Acting Governor by the untimely decease of the late incumbent, and has issued a proclamation announcing the death of Gen. Meagher, paying appropriate respects to his memory, and offering a reward of \$1,000 for the recovery of his body. Governor Meagher, it will be recollected, was drowned by falling overboard from a steamer in the night.

By Mail.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLIOT'S Assay Office, 811 Commercial street, opposite United States Branch Mint. 15v14-3m

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler—repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-1v AUSTIN A. WELLS, Agent.

Latest Stock Prices Bid and Asked.

Table listing stock prices for various companies and bonds, including United States Bonds, California State Bonds, and various mining stocks.

One copy, per annum, in advance, \$5 00  
One copy, six months, in advance, \$3 00  
For sale by Carriers and Newsdealers.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. If it is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

MR. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

DR. L. G. YATES is our duly authorized traveling agent. July 6, 1867.

MR. A. B. BUTLER is a duly authorized traveling agent for this paper. July 15, 1867.

MR. W. D. ROOT is an authorized agent for this paper for Nevada State. August 1, 1867.

MR. H. C. ROEDERER is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Sept. 7, 1867.

## Notices to Correspondents.

I. S., Virginia City.—Carbon, boron and silicon are non-metallic, elementary substances or bases, which possess many properties in common. In the same series, it is not improbable that zircon, the base of the hyacinth (mineral, not flower) will eventually also be comprised. Carbon, in its purest state, is found colorless, in a crystalline form, as transparent diamonds. It is, however, more familiarly known in a less pure condition, as graphite or plumbago and ordinary charcoal. Boron is not known in any uncombined form in the mineral kingdom, though, to some extent, it is found naturally as boracic acid in the Tuscany lagoons, and as boracic acid, combined with soda, in the Tincal lakes of Thibet, and at Clear Lake, in this State. The same acid, combined with lime, is found in South America. The chief minerals which contain it are schorl and tourmaline. Silicon, associated with oxygen, is the most abundant mineral substance known to us; its purest condition being seen as colorless quartz crystals. Sand and sandstone rock are nearly wholly composed of it, and a very large percentage of almost all ordinary clays and soils also consist of it. We do not dwell upon the varied conditions under which carbon is found in nature; what has already been stated will suffice for such a familiarly known subject. The characteristics of boron and silicon, in their primary condition, are much less, in fact, scarcely at all known, and will thus excuse some more lengthened remarks respecting each. Boron is a combustible radical, in like manner with carbon, iron, copper, calcium, etc., and burns, at a high temperature, similarly to those substances when heated in the presence of oxygen. Boron has hitherto been generally obtained by decomposing the compound so formed (boracic acid), or its combination with fluorine and potassium (borofluoride of potassium). Boron hitherto obtained by these means generally possesses a dull, olive-green color, and is in the form of powder, which, before it has been strongly ignited, will soil the fingers, like graphite, and is, to a very slight extent, soluble in pure water, forming a greenish-yellow solution. Boron is unacted upon by exposure to air, water or alkaline solutions, at common temperatures, either cold or boiling. The first experimentalists found that after exposure to intense heat in vessels from which air is excluded, it becomes denser, and dark in color, but failed to crystallize or fuse it. In the form first described, boron exhibits a strong affinity for oxygen, and takes fire below redness, in heated air; burning with a red light, and emitting vivid scintillations if surrounded with pure oxygen. Boron thus becomes superficially converted into boracic acid, which melts, and thus protects the boron in the interior from further action. Deville and Wohler have, however, recently succeeded in crystallizing boron (mistakenly described as borax), as stated in our publi-

cation of the 27th of July last, page 51, which, although artificially produced, is said to have possessed a brilliancy almost equal to the diamond, and of an exceeding hardness. Fused, or, as it is commonly termed, glass of borax, has long been employed as a flux by assayers; and, although it occasionally looks like well polished glass, it is by no means comparable with the diamond, either as respects hardness or durability. The mistake into which you have been led has, no doubt, been caused by the original typographical errors which have been copied from our journal to another, and thus traversed the customary circle, and caused you to make the fruitless attempts to obtain the same results as Deville and Wohler. It may be worth mentioning that the best imitation of the diamond, so far as brilliancy is concerned, invariably contains portions of boron and silicon. Silicon, the radical of quartz, is obtained by modes not greatly dissimilar from those for procuring boron. As hitherto obtained, silicon has the appearance of a dull brown powder, insoluble in water, and soils the fingers when touched, like the preceding described elementary substance. When heated in air or in oxygen, it burns brilliantly, and is converted into silicic acid (silica or quartz), which is the only known oxidized form of silicon. The intense heat evolved in the course of ignition causes the silica so formed to fuse, and thus enclose the unburned portion of silicon in a superficial coating, impervious to further action. Up to the present period, silicon has never been either fused or volatilized. Deville, by a peculiar process, succeeded partially, so as to form brilliant plates, possessing a metallic luster; although possessing many of the characteristics which the powder above described presents, subsequent to having been intensely treated in a closed platinum crucible, in which condition it has been found to be unacted upon by air or oxygen, even while these gases are urged by a blow-pipe. Silicon so treated becomes much denser and of a darker color. We think it is by no means improbable that silicon may yet, like boron be crystallized; in which case it is quite probable that a gem may be obtained equal and probably superior to the diamond, both as respects hardness, durability, and probably brilliancy, also.

A SUCCESS.—We understand that the experiment which has been for some time in progress of preparation, for testing the burning of petroleum for steam purposes, by the employment of an apparatus invented and patented by Mr. J. H. White, of this city, has resulted in a success. The experiment was made at Santa Cruz, and we hope soon to be able to give a full report of the process and device by which it has been accomplished. Experiments in this direction, which have been for some time in progress in the Atlantic States and in Europe, have been watched with much interest. Their success may be pretty safely set down as an accomplished fact. The question now is, which of the several methods by which it is accomplished, is the most preferable one. California will put in pretty strong claims for the prize; and we venture the opinion that she will win.

LEAD SMELTING WORKS—PERHAPS.—We observe that workmen are engaged in grading and clearing away a piece of ground on the North Beach, near the Pioneer Woolen Mills. We understand the lot is owned by T. H. Selby & Co. If we are correctly informed on this point, we think the assertion may be ventured that that enterprising firm is making preparations to put up their long contemplated Lead Smelting Works. If such is the intention, the enterprise is an important one to the city and coast, and the works will be constructed on a scale and after a plan which will admit of no failure. Mr. Selby belongs to that class of our citizens who never undertake anything that they do not fully understand, and which they are not prepared to carry out to its ultimate success.

A NEW use has been discovered for crude petroleum. Saturate rags with it and put them in rat holes, and the rats will leave the premises.

## Industrial Progress of California.

The manufacture of chemicals is one of the most important enterprises connected with the industrial interests of any people. Without such manufacture, no nation can be really independent, as nearly every branch of industry is more or less dependent upon chemical principles. Hence we find considerable attention was turned in this direction, even in the early history of this city. For the ten years previous to the commencement of 1867, nearly all the acid manufactured on this coast was made at the San Francisco Chemical Works, near the Mission Dolores, which institution has done good service to the State in supplying it, at a fair price, with some of the most indispensable articles of commercial necessity.

## THE GOLDEN CITY CHEMICAL WORKS.

The capacity of these works, however, not being equal to the demand, it was thought advisable by some of our enterprising capitalists, about eighteen months since, to put up still larger works. Accordingly several of our most wealthy and enterprising citizens united as a corporate body, under the title of the "Golden City Chemical Works," and, with a capital of \$500,000, established the acid manufactory, now well known to the business community, at the corner of Townsend and Seventh streets. The two articles to which this company is chiefly devoting their attention is the manufacture of sulphuric and nitric acids. Mariatic acid and chloride of lime are also manufactured here, and will continue to be furnished to an extent commensurate with the demand for those chemicals in this market. The two first named are of the utmost importance to the State, being extensively used by the Mint, the gold and silver refineries, many of our mining operations, and our candle and woolen manufactories. Until this establishment went into operation, our supply was chiefly obtained from the East, at great cost and inconvenience, in consequence of the dangerous nature of its transportation.

The high price of labor here renders it necessary that in establishing manufacturing operations of any kind on this coast, especial regard should be had in securing the highest attainable directing skill, the most improved processes, and the most complete and effective class of machinery. Many manufacturing enterprises on this coast have failed for the want of some or all of these essentials. In the establishment of the Golden City Chemical Works, however, the foregoing considerations were duly accepted and acted upon. The consequence has been an uninterrupted success from the start.

## THE MANAGEMENT.

No sooner was the construction of these works decided upon, than it was determined to send to Europe for a practical and skillful manipulator, who could properly design and operate them with the introduction of all the latest and most approved appliances. The result of this determination was the procurement of Mr. William Robinson, who has had long experience in one of the largest and most complete establishments of the kind in England. The plan and design of the works was therefore entrusted to Mr. Robinson, who has most faithfully and skillfully carried out the trust committed to his charge, and since acted in the capacity of foreman to the company. The works were erected under the personal supervision of Mr. H. P. Wakelee, who is one of the five trustees of the company, and who continues as General Manager of the works. Much assistance has also been rendered by Mr. Thomas Price, the well known chemist of this city, who has acted as experimental chemist for the company from its start.

## SULPHURIC ACID—ITS MODE OF MANUFACTURE.

Sulphuric acid forms the foundation for the manufacture of nearly every other kind of acid, and enters many times more largely into use in the various industrial pursuits than all other acids combined. It is the most stable and useful of the oxides of sulphur. Liebig says that the quantity of

sulphuric acid used by any country affords the best key to the extent of the manufacturing operations of that country. Its application to arts and manufactures is almost universal, and without it the larger portion of the present industrial pursuits of man would come to naught.

Until within about a hundred years, its mode of production was very rude, slow and expensive. The present degree of perfection in its manufacture has been reached only by gradual approximation. Among the most important improvements which have been introduced within the last twenty years, is one by the eminent French chemist, Gay Lussac, and which is known as the Gay-Lussac tower or absorbing column, of which we shall speak further in the sequel. Another is the introduction of steam into the chambers. Perhaps, however, the most important one is that which will hereafter be noticed as in use at the Golden City Works; but which is, nevertheless, quite unknown in similar establishments in the Atlantic States, and employed in but two or three instances in Europe. It was first devised, some four years since, by the Messrs. Christian, Allusen & Co., at Newcastle-on-Tyne, where Mr. Robinson received his practical education, and by which the process of the concentration of sulphuric acid is made continuous, instead of intermittent, or in charges.

Without trying to fix in the mind of the reader the precise form and arrangement of this particular manufactory, we will endeavor to give a brief and comprehensive description of the process of the manufacture of sulphuric acid.

The first step is effected by burning the sulphur in a nearly closed room or oven, with an iron floor. The room is made rectangular in form, instead of oval, like a baker's oven, but about the same size as such an oven. The iron plate on which alone the sulphur is burned, covers only about two-thirds the area of the floor. The sulphur, broken up quite small, is spread about half an inch deep over this iron plate. About fifty pounds constitutes a charge. Three small open, iron pots, with legs, raising them about two inches above the floor, are set at intervals, in a line, lengthwise across this floor, into which is placed a quantity of niter, (the nitrate of soda obtained from Peru is used here), equal to four per cent. of the sulphur introduced upon the floor. A small quantity of sulphuric acid is poured over this niter, for the purpose of decomposing it, and liberating the oxygen which it contains, to unite with the fumes of the sulphur for the formation of sulphurous acid gas, which is subsequently condensed into sulphurous acid. From this, it will be observed that the office of the niter, placed in the oven with the burning sulphur, is simply that of a carrier of oxygen to the sulphur, experience having proven the remarkable fact that the oxygen of the atmosphere will not at once leave its association with nitrogen, to combine with the sulphurous acid, although it is from that source that the last equivalent of oxygen required to convert sulphurous into sulphuric acid is derived. All being ready, a lighted match is applied to the sulphur, which is allowed to burn very slowly with a degree of energy, easily regulated by the amount of air admitted. The furnaces which are usually constructed in sets of four, have to be charged anew every two hours.

There are two sets at the works on Townsend street. The fumes from the furnaces are conveyed upward and rearward into a large leaden condensing chamber. There are three of these chambers here, each connected with the other by small "tunnels" or connections some 200 feet long, and four feet square. These chambers are so arranged that the sulphurous gases pass first into one, where, after being dispersed over its whole area, and to a considerable extent condensing, either upon its walls, or collecting and falling like drops of rain from a cloud, upon the bottom of the chamber, the still uncondensed gases pass through the "tunnel" to the next chamber, where they are still further condensed, then to the third, and from thence through the Gay Lussac tower, to be hereafter described, to escape free.

The gases enter the first chamber at a temperature but little, if any above the boiling point of water (212°), and become gradually cooler, as they pass along until they descend to a temperature about equal to the outside atmosphere, before they escape into the open air.

We should, perhaps, before this have mentioned the fact that a small jet of steam is admitted into the first chamber, the office of which is both curious and interesting. We have already said that the gases in the chambers were condensed, both on the walls and throughout the interior area, falling in drops like rain into a bath of water covering the bottom of the chambers.

Previsions to the use of steam, the gases condensed in the form of white snow instead of drops of liquid, and fell into the water at the bottom, where they were dissolved. The interior of one of these chambers, worked without steam, must have been a gorgeous sight—resembling a thick snow storm in an amber colored atmosphere. The introduction of steam has changed the scene from a snow storm of solid crystallized sulphuric acid, to a rain storm of liquid acid. The change, however, is a most important one in an economical point of view, the chemical reactions going on much more satisfactorily in a moist atmosphere, than in the liquid on the floor of the chambers.

The chambers are built up with sheets of lead, soldered together by a peculiar process (as the acid would destroy the ordinary "solder" in a very short time), and are supported by being attached to an outside framework. Those at the Golden City Works are each 100 feet long by 20 wide and 20 high, and are made of sheet lead, weighing seven pounds to the square foot. The lead was made at the San Francisco Lead Works of T. H. Selby & Co.

The quantity of gas which is condensed in the first chamber is much greater than that in the second, and in the second than that in the third; consequently it takes longer to raise the acid in the second and third chambers to the proper strength for condensing it than in the first. It will be borne in mind that the acid is produced from the snow or rain-like deposits from the condensed fumes in the chambers falling into the water which covers their floors, and which is thus gradually raised to the degree of strength proper for removal to the condensing pan. This degree of strength is from 50° to 55°, Beaumé. There is an arrangement by the side of each chamber by which a small portion of the acid, as it is formed, is carried to the outside, where it can be accurately tested, so that the foreman may always be informed of the exact quality of the acid he is obtaining.

The production of sulphuric acid in the chambers is the result of a series of rather complicated and probably not even yet fully understood re-actions. The charge of this portion of the process requires much care and skill. The chambers may be hadly worked or overworked—too much or too little sulphur may be burned within a given time; or too much or too small an amount of fumes may be given off from the niter kettles.

**BOILING DOWN OR CONCENTRATING PROCESS.**

The acid is taken from the chambers varying in strength, as already stated, from 50° to 55°, Beaumé, and conveyed by pipes (acting automatically, after they are connected with one or the other of the chambers) to the boiling or concentrating pan. This pan is a shallow leaden vessel, sustained in a wooden frame, and placed in another wooden pan, similarly sustained, with a stream of cold water passing between the two. The furnace is not under, but in front of the pan; the heat passing over the acid in the pan as over the hearth of a reverberatory furnace. A small stream of acid is kept constantly passing into this pan from the condensing chambers, standing constantly about ten inches deep therein. As the evaporation takes place from the surface, the surface acid, being relieved of its watery particles, becomes gradually heavier and sinks to the bottom. The pan has a small projection, which reaches outside of the furnace, and forms a kind of "well," which is divided across its center by a leaden diaphragm, which extends to within half an inch of the bottom. The heavier acid sinks to the bottom of this well, passes under the diaphragm, up on the other side, and thence over a lip into a trough, which conveys it away to the reservoir, from which it is removed into carboys for commercial use.

This well, being outside of the furnace, can be readily inspected at any time, as the heavy acid on one side of the diaphragm may always be seen standing about half an inch lower than the lighter on the other side—that difference in the height of the columns of liquid being due to the difference in the specific gravity between the lighter, or about 50° acid, and the concentrated, or 64° acid.

Thus, from the charging of the furnaces with sulphur and niter to the placing of the concentrated commercial acid in the reservoir, it is not once handled. It is even removed from the reservoir to the carboys by means of a syphon. This continuous action was first introduced, as already stated, by Mr. Robinson's former employers in England, and is here, for the first time, introduced on this continent. Other manufacturers fill their concentrating pans, keep up the heat until the quantity is concentrated to the proper specific gravity, allow

the fires to go down, the acid to cool off, re-charge the pan, rebuild the fires, etc. The saving by this continuous action is said to be fully fifty per cent. in fuel and one-third in time—a most important consideration.

The above is only commercial acid. The strongest sulphuric acid cannot be concentrated in lead pans, owing to the fact that when stronger than 64° it attacks the lead, and, consequently, subjects the pan to a serious wear and tear, besides causing the acid to be contaminated with the lead, which is very objectionable, especially for refining gold and silver. In order to concentrate the sulphuric acid to 66°, the 64° acid is, at the Golden City Works, pumped from the reservoir aforementioned into large glass boilers, holding some thirty gallons each, and then boiled for fifteen hours before the two last degrees of concentration are attained.

We have thus carried the reader through the process of the manufacture of the commercial and the extra commercial sulphuric acid. In a future article we shall describe the process of making nitric and muriatic acids and chloride of lime, all of which are produced at this establishment. We shall, at the same time, describe the use and construction of the Gay Lussac tower, above alluded to.

**Second Report on the Pacific Mines.**

The forthcoming Report on the Mineral Resources of the Pacific States and Territories will contain copious descriptions of the mineral and agricultural resources of Utah, Montana, Idaho, Washington Territory, Oregon, California, Nevada and Arizona. A large and experienced corps of geologists, mining engineers, experts and statisticians have been engaged upon it during the past six months.

Dr. A. Blatchley has traveled extensively through Utah, Montana and Idaho, in the service of the Commissioner, and has already prepared an elaborate report on those interesting regions, combining geological and statistical data of a valuable character.

Mr. W. S. Keyes, who made the admirable report on minerals of the Pacific coast in Langley's Directory, is preparing an elaborate paper on the Argenta and adjacent districts in Montana.

Mr. W. Lair Hill, author of a prize essay on the resources of Oregon, furnishes a large amount in reference to the productions of that State.

Mr. Ainsworth, President of the Oregon Steam Navigation Company, contributes a most interesting paper on the navigation of the Columbia and its tributaries, with statistics of passengers, freight, etc.

Mr. Edward Evans, late Secretary of Washington Territory, reports on the resources of that region.

Mr. John S. Hittell has traveled extensively through the mining districts of California this summer, and furnishes valuable statistics and observations.

Mr. E. F. Bean, County Assessor of Nevada county, takes charge of the mineral resources of that region.

The State of Nevada is represented by full and authentic reports from R. H. Stretch, Dr. Henry DeGroot and Myron Angel—all of whom have had extensive experience.

Arizona will not be slighted this time. Gov. McCormick has collected data from all parts of the Territory, which will be embodied in a comprehensive report.

The miscellaneous resources of the Pacific coast will be embraced in a most interesting and valuable series of papers, already nearly completed, by Mr. Henry C. Bennett, mining engineer and statistician.

The Commissioner's report also embraces a glance at the condition of the mining interests in Mexico and South America, with observations on the product of the precious metals throughout the world. He has himself, this year, visited Sinaloa and Lower California, the principal districts of Upper California, Oregon, Washington Territory and British Columbia, and collected a vast amount of valuable material.

Prof. W. M. Gabb has furnished an interesting report on the geology and mineralogy of Lower California, which will be em-

bodied in the Commissioner's report, and is also expected to furnish, by permission of Prof. Whitney, in whose employ he is now making a scientific reconnaissance of the Pahrnatag region, a summary of his observations in Southwestern Nevada. Besides this, statistical information has been received from various superintendents and mining engineers from Arizona and British Columbia.

The Commissioner, J. Ross Browne, Esq., will leave this city for Washington early in October, to present his report in person, and to attend to its early and proper distribution after it is printed. It will be recollected that great delay attended the delivery on this coast of the first report. But two or three copies only were received here until some two or three months after it was due; and even to this time not half the newspaper offices in the State are supplied with the document. No such delay or neglect will attend the publication of the next report.

**THE PATENT OFFICE.**—We learn, through the Washington correspondent of the New York Herald, that the Secretary of the Interior has at length decided to give up to the Commissioner of Patents a sufficient number of rooms in the Patent Office building to allow one room to each chief examiner, and that it is the intention of the Commissioner to appoint without delay, the new examiners and clerks authorized at the last session of Congress. We therefore have now some hope that the arrears of the business of the Patent Office will be speedily worked up, and that applications will soon be acted upon with some degree of promptness.

**THE SURVEY OF THE COLORADO.**—The Springfield Journal says that Capt. Adams, who has been for some months in Washington, endeavoring to get authority to fit out an expedition for a survey of the Colorado river, has at last received such assurance, in official and Congressional circles, as to justify him in making all preparations to a full survey, and he will start at once for this city, and thence to the present head of navigation on the Colorado. The enterprise is regarded by all who understand it as one of very great importance, and it is claimed that it will give water communication with the Pacific from points not very remote from either Salt Lake or Denver. Transportation expenses of the Government for posts in New Mexico and Arizona will be reduced nearly one-half if the river proves practicable as far as claimed.

**NORTH AMERICA**  
**Life Insurance Company.**  
 Usual Restrictions on Occupation and Travel  
**ABOLISHED!**  
 Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.  
 The most Responsible and Liberal Company in the World!  
**J. A. EATON & CO.,**  
 Managers Pacific Branch, 392 Montgomery st.  
 20v14n9o SAN FRANCISCO.

**WESTGATE'S PATENT**  
 NON-CONDUCTING  
**SAD IRON AND SAD IRON HEATER**

Is the best and cheapest Ironing Apparatus ever invented. It will save fifty per cent. of Fuel. No family should be without one. For sale by  
**LOCKE & MONTAGUE,**  
 10v15-2t 112 and 114 Battery st., San Francisco.

**Builders' Insurance Company—**  
**OFFICE IN THE BUILDING OF THE**  
 CALIFORNIA SAVINGS BANK, California  
 street, one door from Sansome street.  
**FIRE AND MARINE INSURANCE.** 10v14n9qr

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this Journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purpose, will address their letters to "Westfield, Mass."

For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the **NEW YORK GALLERY**, Nos. 25 and 27 Third street. Every picture warranted to give perfect satisfaction.  
 5v15qr B. F. HOWLAND, Artist.

**Perry Davis' Vegetable Pain Killer.**  
 We clip the following from the Providence (Mass.) General Advertiser:  
 "At this season of the year, when cholera, cholera morbus, dysentery, and other kindred complaints are sure to prevail, everybody should be liberally supplied with Perry Davis' Vegetable Pain Killer. Persons leaving home, whether it be for a day's excursion or a trip to Europe, should be in a condition to place their hands upon it at a moment's warning. Many diseases incident to the summer months, which will prove fatal if not immediately checked, can be promptly cured by one or two doses of the Pain Killer. On more than one occasion have we been relieved of intense suffering by the timely use of the above named preparation.  
 Sold by all Druggists, Grocers and Medicine Dealers everywhere. 10v15-1m

**ROOT'S**  
**Patent Force Blast Blower.**  
 Adapted for Smelting, Foundry, Mining and Steamships.  
 Requires 50 per cent. less power than any Blower now in use. For further particulars, address **KEEF, BLAKE & CO.**, Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15q19p

**Oakland College School.**  
 THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California. The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art. The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided. Throughout all the various departments, great attention is given to the study of the Modern Languages. For further information, or Catalogues, address,  
**I. H. BRAYTON, Principal.**  
 OAKLAND, California. 5v15qr9p.

**LINSEED OIL.**  
**The Pacific Linseed Oil & Lead Works**  
 Are now prepared to furnish dealers and consumers  
**Pure Linseed Oil,**  
 Raw or Billed, at the Lowest Market Rates. We call especial attention to the quality of our Oil, believing it to be superior to any imported Oil offered in this market. Also, Oil Cake Meal, the best article known for fattening stock and increasing the product of milk.  
 Cash paid for Castor Beans and Linseed, on delivery at the factory. Address,  
**Pacific Linseed Oil and Lead Works,**  
 Care of L. B. BENCHLEY & CO.,  
 19v14-3m9p San Francisco.

**PACIFIC**  
**Rolling Mill and Forge Co.,**  
 SAN FRANCISCO, CAL.  
 Established for the Manufacture of  
**RAILROAD AND OTHER IRON**  
 —AND—  
**Every Variety of Shafting**  
 Embracing ALL SIZES of  
 Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames.  
 —ALSO—  
**HAMMERED IRON**  
 Of every description and size.  
 Orders addressed to **PACIFIC ROLLING MILL and FORGE CO.**, Post Office, San Francisco, Cal., will receive prompt attention.  
 The highest price paid for Scrap Iron. 5v15-3m9p

**DR. FONDA'S**  
**San Francisco Eye Infirmary.**  
 Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years principal of the Lafayette (Ind.) Eye Infirmary. F. W. FONDA, M. D., Surgeon in Charge, Office, 402 Montgomery street, opposite Well, Fargo & Co's. 4v15-1y9p

**AGENTS WANTED**  
 DYPERETIC MEN OR WOMEN CAN MAKE MONEY IN canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one Book in three days. Address, **PACIFIC PUBLISHING COMPANY,** 5v15qr9p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Bag, straw and Drop Presses, Colling Machinery, Pile Drivers, Bark and Mill Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Steam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenos Wheeler's improved flat bottom pan, Feldin's pan, Yeater's tubs, Prator's concentrators, Wakle's pans, Soer's pan, Guyan Barrels, Anastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. SLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russian Iron Screws, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT  
24v12

A GOOD WORD FOR CALIFORNIA.—An exchange of a late date says: "The appearance of California flour in the Atlantic markets, and in such quantities as to bring down prices and carry joy to thousands of consumers, is a commercial event of no little importance. It seems but yesterday that California was one vast prospecting field for miners, who obtained their supplies from the East, and at a pretty high cost, too; but it was found, before long, that some of her people could do better by feeding the others than by all going into the gulches together, and then it was discovered what a glorious agricultural State California is capable of being made. Her soil is rich in nutritive as well as mineral properties, and is easily worked, while her climate is exceeded nowhere else in the Union. The result is, the flow of breadstuffs has already set back to the Atlantic, and with such force as to confound speculators and relieve our community from the pressure of an unwanted scarcity.

TOWNE & BACON,  
Book and Job Printers,  
Have the Largest Office,  
Do the most work,  
And do it better  
Than other offices

In this City,  
**536** Try them  
With a Job,  
And you will be  
Satisfied the above  
Statements are facts.  
Their office is at 536  
Clay St., below Montgom'y,  
Over Pacific Fruit Market.

**Machinists and Foundries.**  
**PALMER, KNOX & CO.,**  
**Golden State Iron Works,**  
Nos. 19, 21, 23 and 25 First Street,  
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF  
**MACHINERY,**  
**STEAM ENGINES AND QUARTZ MILLS**  
DUNBAR'S IMPROVED  
**Self-Adjusting Piston Packing,**  
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S  
**NEW GRINDER AND AMALGAMATOR**  
HEPURN & PETERSON'S  
**AMALGAMATOR AND SEPARATOR,**  
**Knox's Amalgamators,**  
WITH PALMER'S PATENT STEAM CHEST,  
Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.  
**Genuine White Iron Stamp Shoes and Dies.**

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 18v13-17

**WILLAMETTE IRON WORKS,**  
PORTLAND, OREGON.

**Steam Engines, Boilers,**  
**SAW AND CRIST MILLS,**  
MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.  
Corner North-Front and E streets,  
18v13-ly One block north of Couch's Wharf.

**UNION IRON WORKS,**  
Sacramento.

**WILLIAMS, ROOT & NEILSON,**  
MANUFACTURERS OF  
CROSS' PATENT BOILER FEEDER,  
**STEAM ENGINES, BOILERS,**  
And all kinds of Mining Machinery.  
Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.

**Dunbar's Patent Self-Adjusting Steam Piston**  
PACKING, for new and old Cylinders, manufactured to order.  
Front Street, between N and O streets,

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED and SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**NEW USE FOR THE BAROMETER.**—Mr. J. Rofe writes to the *Geological Magazine*, and shows that colliery proprietors have only to watch the barometer, and provide in accordance with its indications for the supply of air to the mines. Alluding to the well known "Blowing Well," of Preston, in Lancashire, he states that some time since, in a well recently constructed by him as a cesspool to some chemical works, he observed the phenomena characterizing the "Blowing Well." When the atmospheric pressure diminished, the air came from the well loaded to a disagreeable extent with the offensive vapor from the cesspool. On continuing his observations with a barometer, he found similar results. He concludes from these facts that a coal mine must be regarded as a gigantic well, from which, when the atmospheric pressure diminishes, the air expands and rushes out with great violence. This circumstance is not of itself dangerous; but if there be an excess of gas in the mine, and at the same time, from accident or carelessness, a means of ignition, then, indeed, the consequences are very likely to be serious. Hence the barometer becomes the miner's safest guide.

**FIRST Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**  
Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**  
It is for all exposed surfaces; impervious to water; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of this large building, the New York Glass Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years sure keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.  
**NEW CLOTH ROOFS** put on; copious and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamships, etc., around New York—over eight dollars per one hundred square feet. **NEW OR OLD TIN ROOFS** cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.  
We have just cemented and painted old tin roofs of Dr. H. D. Cheswell, Tubbs & Co., D. J. Oliver, etc., and the work of Sheriff Davis' building, 85 feet front, on Folsom street, between Third and Fourth streets—only one cent. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cheswell's building, corner of Front and Clark streets—one cent. See the above and further references at our office.  
**ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT** is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters, and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.  
**EPES & E. H. R. ELLERY** are now prepared to make good roofs and cement and paint new or old ones, and do all kinds of painting with Ellery's Patent India Rubber Paint. An asphaltum or coal tar used.  
Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

MOSHEIMER'S PIONEER MINING SCHOOL —AND— Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches: 1. Assaying of ores, metals and other mineral substances. 2. Technology, or Chemistry, as applied to any special branch of manufacturing. 3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5. Concentration. Dressing of ores. 6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology. Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are safe an investment as any other business when properly understood and managed; therefore, learn first, if you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful. It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufactories erected on my own account, have not only given me lessons, but more than ordinary ability. I was the first one in California who successfully extracted silver by smelting, on a large scale, and have since been traveling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process. I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works. My lately invented Roasting Furnace has the following advantages: A Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas of quicksilver when amalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores..... \$3 00 Copper ores..... 5 00 Practical Chemist, Metallurgist, etc. Office, No. 328 Montgomery street, San Francisco, Cal. 6v15-3ms

Metallurgy.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

GAINED HER INDEPENDENCE.—The South went to war for independence, and actually gained it—although but very few, even of her own people, are aware of the fact.

New Mining Advertisements.

Ancient River Channel Blue Gravel Company

Location: Nevada County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of September, 1867, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company 408 California street, San Francisco.

Neagle & Co. Silver Mining Company.

Location: Storey County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of September, 1867, an assessment of fifty cents (50c) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company 408 California street, San Francisco.

Mount Teabon Silver Mining Company.

Location of Works: Cortez District, Lander County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of September, 1867, an assessment of three dollars (\$3) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, in San Francisco.

Potero Company.—Location of Works: San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of two dollars and a half (\$2 50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at No. 533 Kearny, corner of Sacramento street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, (Room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

To Capitalists.

GOLD QUARTZ MINE, SITUATED IN CALAVERAS COUNTY, with steam mill fitted up with manufacturing pans, etc., FOR SALE. The mine has three main veins, and more than \$20,000 has been spent in opening them and completing the mill. Good water runs all the way. Apply to BELLO, FRERES, Bankers, 535 Clay street, San Francisco.

Mining Notices—Continued.

Ancient River Channel Blue Gravel Company.

Location of Works: Nevada County, California. Notice.—All persons are cautioned against purchasing the following Certificates of Stock in the Ancient River Channel Blue Gravel Company, as the transfer has been stopped on the same:

One Certificate, No. 82, for 125 shares; one Certificate, No. 6, for 10 shares; one Certificate, No. 27, for 15 shares. A. P. MORE, San Francisco, August 26, 1867.

Postponements and Alterations.—Securities are requested to give notice of postponements, or alterations which they may desire to make in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary. Office, N. E. corner Front and Clay streets, San Francisco, California. au3

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with the quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The machine can be seen in operation.

At Both & Co's Union Foundry, up stairs, Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR. For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100. The box will answer for wood. By reference to the Mining and Scientific Press of May 25th, a full description of the above machines may be found. For particulars, send for Circulars, or address ANDREW HUNTER, Union Foundry, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1865.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast.

San Francisco.

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Trucks built to order. No. 28 Second St., and 108 and 110 Jessie St. San Francisco.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

- No. 1—Or 9 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600
No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour, \$850
No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and eccentric laws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fallon Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: Rawhide Ranch, Tuolumne Co., Sept. 28, 1865. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use at the Rawhide Ranch, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. BRODIE & RADCLIFF, Express Building, 402 Montgomery Street, San Francisco.

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALED AND UNRIVALED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERNCES.—E. Stockton, Folsom; O. Simmons, Oakland; Mill at Clear Lake; Moran, Coville, Lexington; Santa Clara County; J. McMillan, Lexington Santa Clara County. SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated Hartford Engine,

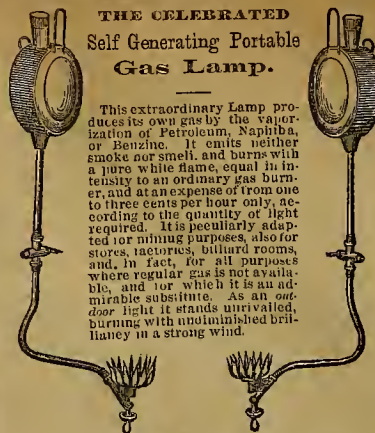

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine, Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO., Pacific Iron Works, San Francisco, Aug. 29, 1867.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draftsmen, by applying to this office.

THE CELEBRATED Self-Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use. Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v14-3n-3

NELSON & DOBLE, AGENTS FOR Thomas Firth & Sons' Cast Steel Files, Etc., Shear, Sring, German, Flow, Blister and Toe Caik Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, San Francisco.

PATTINSON'S HURDY-GURDY WATER-WHEEL.

The Inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "Hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. THOMAS PATTINSON. 7v15-4y

Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE M. PRAG'S Improved Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG, 8v13-ly Stove Store, No. 126 Clay street, below Davis.

THE ATLANTIC CROSSED ON A RAFT.—The life-raft Nonpareil made the passage across the Atlantic in forty-three days, conducted by John Mikes as Captain and George Miller and Jerry Mallene as crew. These men have thus made one of the most remarkable voyages on record. The raft is only twenty-four feet long by twelve and a half wide, and consists of three cylinders, pointed at each end, united together by canvas constructions, having no real deck. It is strengthened by boards slipped under strong iron neck-pieces, the whole kept together by lashing. A water-proof cloth hung over a boom, closed at each end, somewhat resembling a gipsy tent, affording sleeping accommodations for two at a time, the third keeping watch. This is fixed on a strong locker, in which the provisions are kept. The raft lay to seven times from stress of weather. They arrived in perfect health, the men in good spirits, and their countenances looking healthy and bronzed by the weather. They had no chronometer on board; but sailed by dead reckoning, and corrected their position by vessels they spoke. The raft has kept perfectly watertight all the way, not a leak of any sort having occurred. She is fitted with an apparatus for filling the tubes with air. On the arrival of the raft at Southampton, J. R. Stebbing, the President of the Chamber of Commerce, went on board, congratulated the crew on the success of their daring enterprise, and tendered them any good office that might be required.

ADMIRAL FARRAGUT is, in rank, the highest naval officer afloat. His station corresponds to that of Lord High Admiral in England—an office which has not been filled since 1828, and which can only be filled by a prince of the royal blood. Prince Alfred is now training for it—a necessary preliminary, as English public sentiment will no longer tolerate the appointment of green-horns to high posts of honor, as it once did. Prior to the rebellion, the highest legal rank in our navy was that of Post Captain; the title of Commodore was one of courtesy. The indifference or jealousy of the country against the navy was so great that no higher rank could be obtained from Congress, although the navy won the first battle in the war of 1812. It was only after the unparalleled acts of the navy during the rebellion that ranks assimilating to those of foreign nations could be created for the navy. The insignia of rank in our service is: First—The Admiral, who wears a square flag, blue, with four white stars, worn at the main. Second—Vice-Admiral, square flag, blue, with three white stars, worn at the fore. Third—Rear-Admiral, square flag, blue, with two stars, worn at the mizzen. Fourth—Commodore, broad pennant, blue, with one white star, worn at the main.

BULLION PRODUCT OF THE MINES ON THE COMSTOCK LOPE FOR 1866 AND THE FIRST HALF OF 1867.—Mr. F. B. Smith, Deputy Assessor of Internal Revenue for the Virginia (Nevada) District, has been at great pains in going over all the figures for the period named, and has furnished the following statement to the Territorial Enterprise, which, that paper says, can be relied on as perfectly correct: The amount of bullion assayed in Storey county from January 1 to June 30, 1866, was \$6,292,002, coin—in currency, \$7,903,759; from July 1 to December 31 of the same year, \$7,875,700, coin—in currency, \$10,169,175. On this, the amount of tax paid the General Government was \$99,766.73. For 1867, from January 1 to June 30, the amount of bullion assayed in this county was \$8,500,377, coin—in currency, \$10,890,050; the internal revenue on which amounts to \$54,450.25. This statement shows a most astonishing and gratifying increase in the yield of the mines on the great Comstock lode.

LARGE BOILER FOR THE NEW IMPERIAL WORK.—In front of the old Imperial hoisting works, Gold Hill, says the Enterprise, is to be seen a huge boiler. It is five feet two inches in diameter, and weighs eleven tons. It originally belonged to the Gold Hill Drainage Company, and was at one time set up at their drain shaft, but was never used, though we believe steam was once raised in it on trial. It is as good as new, and will be moved up to the new Imperial hoisting works early next week, where it will be put in position. It is an immense affair, and should it ever explode—good by to all the northern portion of Gold Hill!

NASAL MEDICINE.—M. Raimbert, a French doctor, practices a new method of introducing medicine in the animal economy, viz.: by the nostrils. He has done so with morphine, which, it seems, introduced in that way, will cure violent headaches.

**COLD IN SPITZENBERGEN.**—No description can give an adequate idea of the intense rigor of the six months' winter of this part of the world. Stones crack with the noise of thunder; in a crowded hut the breath of the occupants will fall in flakes of snow; wine and spirits turn to ice, the snow burns like caustic; if iron touches the skin it brings the flesh away with it; the soles of your stockings may be burnt off your feet before you feel the slightest warmth from the fire; linen taken out of boiling water instantly stiffens to the consistency of a wooden board, and heated stones will not prevent the sheets of the bed from freezing. If these are the effects of the climate within an air-tight, fire-warmed, crowded hut, what must they be among the dark, storm-lashed mountain peaks outside?

Every foot of land on which Belfast, Ireland, is built, is owned by one man, the Marquis of Donegal. Every citizen has to pay tribute to him. His income from ground rent is from one to two millions of dollars per annum.

**SANTA CLARA COLLEGE, S. J.**  
SANTA CLARA, CAL.

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 16th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER AND AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular mullers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old mullers and plates is as thorough and perfect as with new ones. The pulp enters readily between the mullers and side dies, the pressure being light in front and heaviest at the heel of the muller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, side points or iron, accidentally introduced with the crushed ore, as these can readily pass each muller separately, without interfering with or affecting the other mullers, each of which is independent, or can rest upon the bottom below the mullers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each muller can be lifted off separately by hand, and there is no necessity for lifting the revolving one or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the mullers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The mullers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 5 screens. A "slumber," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

EXPLANATION.—E, muller-hanger; F, muller plate or shoe; G, side dies; I, supporting lip; D, bearing surface; T, feeder; X, weight to counter-balance wear of muller plates, or sides; U, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

dies are easily removed at any time, or when worn out, and an extra set of mullers is furnished with each pan sold. It is also adapted for grinding cement, sulphurets, roasted ores, etc.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or miller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six mullers, is about 2,700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of mullers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$300, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 54 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or S. P. RIVERA, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Millers' Poultry, First street, near Polson, where they are manufactured.

Send for Circulars. PHILIP HINKLE, and CHARLES S. CAPP, Patentees, 54 Clay street, San Francisco. 25v14-1f

**LACOUR'S SARSAPARIPHERE BITTERS**

Have so speedily grown in favor that their unrivaled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the fineness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry. The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to a thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

**LACOUR'S SARSAPARIPHERE BITTERS.**

They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by autaneous excretions, and other substances which gently stimulate the secretions of the lower glands and organs, render digestion easy, obviate constiveness, and remove regularly every impurity of the blood.  
They are unrivaled as a remedy for Scrofula, Dyspepsia, Consumption, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

- Who Takes Them?**  
**The Old Man**  
Takes them as a gentle stimulant and mild rejuvenator.  
**The Young Man**  
Takes them to regulate his system, prevent disease, and stimulate to new life his overtaxed body.  
**The Young Woman**  
Takes them to secure regularity in her habits; to tinkle her cheeks with the bloom of health; to give a sparkle to her eyes, and sweetness to her breath.  
**The Husband**  
Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family.  
**The Wife**  
Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness.  
**Children**  
Take them as a gentle, yet effective tonic.  
**The Dushaway**  
Takes them as a mild, pure stimulant, containing none of the deleterious, essential and fustilious of forbidden drinks.  
**The Inebriate**  
Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does not madden or destroy.  
**The Traveler**  
Takes them to prevent sea sickness, and secure his health against change of climate.  
**Everybody Takes Them!**  
PRO BONO PUBLICO!

**A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry,** is desirous of securing a position in some assaying establishment, or would like charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office. 3v16-1r

**HIGHT OF MT. HOOD DEFINITELY FIXED.**  
Col. Williams, of the U. S. A., Engineer Corps, who was ordered by the Government to make an official determination of the height of Mt. Hood, has made the ascent and returned to Portland. According to the *Oregonian*, he reports that mountain to be just 11,000 feet high, thus knocking off 6,600 feet from Prof. Wood's calculation, about which there has recently been so much controversy. We understand that the Oregonians are about to petition for an official determination of the height of Mt. Shasta, which has been heretofore reported as 14,500 feet high. The Oregonians are confident they can knock off a little over 3,500 feet from the hitherto reported height of this famous competitor of Mt. Hood, and thus continue to claim to hold within their borders the highest mountain in the United States.

**BLASTING WITH SODIUM.**—The latest received number of the *Journal of Photography* says that experiments were being made in the Isle of Man to ascertain the value of sodium, in contact with water, for blasting purposes. Sodium, it is well known, decomposes water into its two constituent gases; but whether the gradually accumulated force which would thereby be brought to bear in a closed chamber of the rock would be of much avail in disrupting the same, remains to be proved. It could not break it up, as by the sudden explosion of powder, although it would doubtless rend it, until the gases found sufficient room for their accommodation or gradual exit.

**Pacific Mail Steamship Co's**  
STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.  
On the 10th, 19th and 30th of each month that has 30 days.  
On the 10th, 19th and 30th of each month that has 31 days.  
When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.  
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.  
Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.  
Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following steamships will be dispatched on dates as given below:  
September 10th—GOLDEN CITY.....Capt. W. F. Lapidge, Connecting with HENRY CHAUNCEY, Capt. Cray  
September 18th—CONSTITUTION.....Capt. Parker, Connecting with the RISING STAR, Capt. Conner.  
September 30th—GOLDEN AGE.....Capt. J. M. Cavarly, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attend ance free.  
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.  
For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.  
The Steamship CHINA, Capt. E. W. Smith, will be dispatched October 10th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorf streets.  
**OLIVER ELDRIDGE, Agent.**

**THE CENTRAL PARK OF THE PACIFIC.**  
**Woodward's Gardens,**  
ART GALLERY,  
MUSEUM, GYMNASIUM,  
—AND—  
ZOOLOGICAL GARDENS.

ORAND INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays a GRAND CONCERT OF SACRED MUSIC, appropriate to the occasion.  
THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.  
The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic.  
To all departments new attractions are being constantly added.  
These Gardens are accessible by the Howard and Market street Cars.  
Entrances on Mission and Valencia streets, between Thirtieth and Fourteenth. OPEN EVERY DAY.  
Admission to all parts, 25 Cents. Children, under 12 years, half price. 10v15ar

Frauds Among Oregon Wool Growers.  
An Item of Interest.  
Lettre from Esmeralda.  
Eloquizing by Euphorbia.  
Death of an Inventor in an Insane Asylum.  
Patent Business.  
Time to Live.  
Large Masses of Native Silver.  
Agricultural College.  
Mechanical Progress in England.  
Iron Sand in New Zealand.  
Gold Mining in England.  
Growth of the West.  
To Remove Moles.  
Progress of Our Industrial Interests—Continued.  
Poems by C. W. Stoddard.  
Notices to Correspondents.  
New Patents and Inventions Contributed for our Cabinet.  
Mining Shareholders' Directory.  
New Incorporations—List of Officers.

SCIENTIFIC MISCELLANY.—  
The Earth's Celestial Heat;  
New Expedition to the North Pole; Muscular force of Insects; Discovery of a New Planet; Change of Temperature by Mixture of Liquids; Tungsten vs the Black Diamond for Rock Drilling; Minerals at a High Temperature; Carbonic Acid for Extermination of Mosquitoes.  
MECHANICAL MISCELLANY.—  
Origin of Cast Iron Manufacture; The Inventions of Workmen; Iron from Cinder Piles; First Iron from Oregon; Use of Steel in Locomotive Construction.  
MINING SUMMARY—Embracing late intelligence from the various counties and districts in California, Arizona, Colorado, Utah, Montana, Nevada and Oregon.  
San Francisco Market Rates.  
San Francisco Weekly Stock Circular.  
Stock Prices—Bid and Asked.  
San Francisco Metal Market.

## The Large Circular Knitting Machine.

We have given, on another page, a full description of the "Pacific Woolen Mills" of this city, better known as the "Knitting Factory." All the manufactures of that establishment are knit goods. The usual complement of carding and spinning machinery accomplishes the preliminary process of putting the wool into the form of yarn; but no looms are employed—the

fact and very rapid in its operation. It was first invented about twelve years ago; but has since passed through numerous modifications and improvements, before coming to its present state of effectiveness. There are six of these machines at the Pacific mills, constructed in pairs, or two within one frame, instead of single machines as given in the illustration. A stocking machine, although working mainly upon the same principle, is nevertheless quite different in construction from that here illustrated, and

spools or bobbins, which is carried and placed between the needles, by the small wheel just below F, on the right hand side of the illustration. The wheels marked F, F, F, are for pressing upon the work, preparatory to the action of the small wheel under G, the office of which is to press the needles to form the loop or stitch. These machines are capable of turning off a great variety of both coarse and fine work.

### ORIGIN OF KNITTING MACHINERY.

The first knitting machine of which we have any account, was invented about 200 years ago, by the Rev. William Lee, of Leicester, England. Mr. Lee, like most impetuous clergymen, was blessed with a large family of children, and was greatly pained at the large amount of knitting which his good wife had to perform to keep the family supplied with coverings for their feet, and like a humane and sensible man, put his wits to work to devise some machinery for facilitating the work of knitting. The result was a *hand machine*, by which a person could do ten times as much as by the common knitting needles. Others, in the same neighborhood, took up his idea, and continued to improve upon the same, from generation to generation, until the knitting machine has been brought to its present high degree of perfection. Leicester, to this day, is noted as a great center of knitting machinery—its knit goods being now sent to all parts of the world. It has been only until within about twenty years, that power was successfully applied to this ingenious and complicated class of machinery, which has been the subject of a very great number of patents, not less, probably, than that which has given to the world the present perfected sewing machine.

### SACRAMENTO FEMALE SEMINARY.

We take pleasure in calling the attention of the public to the advertisement of the Sacramento Seminary for young ladies, under the charge of Mr. and Mrs. Perry, where all the different branches pursued in institutions of a

similar character are taught by not less than six efficient teachers. The boarding pupils are under the immediate supervision of the Principal and assistants. The gratifying success which has thus far attended this Seminary, gives promise of permanency and a high stand among literary institutions and its constantly increasing patronage has encouraged and necessitated the erection of the new edifice which is to be ready for occupation at the commencement of the next term. The building is of brick, forty feet by sixty in size, and four stories in height, and is located on the highest ground in the city.

## POLITICS, HAND ORGANS AND ORPHANS.

Perhaps the largest crowd ever seen on Montgomery street, blocked that thoroughfare for several hours on Wednesday last. The occasion was the settlement of the "Hayes-Higgins" wager. Michael Hayes and Wm. S. Higgins had made a bet upon the election, the terms of which were, that in case of the success of Haight, Higgins should carry a hand-organ along Montgomery street, from Jackson to Market, and play a tune before each of the principal hotels, *a l'Italian*, collecting contributions in regular style, the sum of which collections should be divided equally between the Protestant and Catholic Orphan Asylums in this city. In case of the election of Gorham, Hayes was to be the performer. The lot, as our readers well know, fell upon Higgins; and manfully did he comply with the conditions of the bargain. The city journals had duly announced the sport; and the whole town seemed determined to "make a day of it." The procession moved with difficulty through the jam. Everybody had his cash ready, and liberally was it showered upon the party carrying the bag. Before Washington street was reached, a thousand dollars had been collected. From almost every house along the entire line of the procession, coin was scattered in single pieces and in packages. The ladies in the hotels gave generously. Halts were made at divers points, while the collectors made raids into the side streets. Hayes, the winner of the wager, staggered under the weight of a large tin box of accumulating silver. Several of the candidates in the late contest, both elected and defeated, joined the procession, and aided in the collection. The continuous cheers most effectually drowned the organ; and fortunately too, for Mr. Higgins having omitted to inform himself in regard to the manner of changing the tune, was compelled to grind out the "same old thing" from one end of the street to the other.

After the terminus of the route was reached, and the "regular" performances were concluded, a number of gentlemen visited the merchants in Front and other streets. The result of their efforts was the filling of *six wagons* with provisions of all kinds, and other goods; all of which, with the money collected, amounting to over \$5,000, will be divided as aforesaid, between the two orphan asylums.

LARGE CIRCULAR KNITTING MACHINE.

goods are put together by *knitting machinery*. There are eight different kinds or classes of knitting machines in this establishment, each designed for its own particular class of work. All these machines are of American invention. There are 39 machines in all—29 of which are small ones, for stockings. The particular machine which we have illustrated herewith, is designed for knitting shirts and drawers. Its work, as will be observed, moves upward and is wound upon a drum at B, the yarn being taken from the bobbins at D. This is one of the latest devised knitting machines, and is most per-

fects its work *downward*, instead of upward.

The above machine is capable of turning off 100 pairs of shirts or drawers each day, of ten hours, either of silk, wool or cotton. By reference to the engraving, the cylinder, A, contains a large number of needles, which, set in a circle around the periphery of the cylinder, revolve rapidly, and knit the webbing at the rate of 140,000 stitches a minute, or 8,400,000 an hour. B is the webbing, which, as fast as it is produced, passes upward and is wound round the shaft or "take up," C. D, is the yarn, on

## Communications.

In this Department we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Entered according to Act of Congress in the year 1866, by F. A. Herring, in the Clerk's Office of the District Court of the District of California.]

## Formation, Distribution and Age of Igneous Rocks.

[Continued from Page 150.]

The non-conducting properties of volcanic ashes are well known, and large quantities of the ashes or condensed vapors of mineral bodies falling upon a plastic or perhaps fluid surface would protect the rock beneath from cooling rapidly, and thus render the condensation of aqueous vapor possible. Water, strongly impregnated with hydrochloric and carbonic acids, coming in contact with the ashes, would tend to deprive them of the alkalis, soda and potash, and thus a crust of aqueous rock would be formed, which would require a much higher temperature for its fusion than the molten matter upon which it rested. The newly-formed crust might have been broken up by innumerable openings, through which the molten matter from a constantly increasing depth was vomited forth; but it is not probable that, when once formed, this altered granite, or gneiss, could have been dissipated, or even fused, by any subsequent igneous action. The rapid contraction of matter by loss of heat at this early period, causing frequent convulsions, which were attended by the corrugation of the thin crust, thereby exposing and subjecting new surfaces to the denuding, disintegrating and degradating effects of the elements, together with the fluid alkaline rock, which was being constantly erupted, would tend to a rapid accumulation of debris, which would be readily cemented into solid rock by the deposition of the soluble silica, which, under such conditions, must have been so abundant in the tepid waters. In consequence of the atmospheric agencies and of the powerful chemical affinities of the elements thus brought in contact, the formation of the earlier stratified rocks must have proceeded with comparatively great rapidity. It is probable that the granite upon which the stratified rocks rest remained plastic during the formation of the gneiss and clay slate systems, and that the stratified rocks of these two periods, together with the intersecting dykes of igneous rock, composed the only portion of the earth's crust that had then become solid. As the solid crust could have been only about four miles or something less in thickness, the surface of our globe must have remained nearly flat and mostly covered with water, and the corrugation or shortening of this thin covering, while adapting itself to the ever-shrinking mass it contained, was effected by the tilting and folding of the stratified rocks, like a loose robe.

During the formation of the gneiss and clay slate systems, the crust increased to twenty-four miles in thickness, of which the stratified rock alone was solid. At or near the beginning of the third or silurian period, the granite began to solidify, and the folding of the slate seems to have terminated. The solid crust could now only accommodate itself to the receding molten mass by forming into long, low ridges, which were permanently raised above the water. Plastic granite began to be intruded along anticlinal lines, in some instances forming immense cones; and it was at this period that the nuclei of many of our present mountain ranges were formed. During the formation of the silurian system, the solid crust increased from about four to some fifteen miles in thickness. Magnesium is the predominating metal in the erupted rocks of this era, the stratified rocks being largely composed of altered porphyry, serpentine, hornblende, greenstone, steatite, etc.

We will pass on to the consideration of the fourth or old red sandstone period. The crust of the earth during the formation of the three preceding periods increased to the thickness of about thirty-six miles, at

which depth the quartzose stratum is supposed to have been reached. The metalliferous stratum is estimated to have been twelve miles in thickness, and as gold expands more rapidly than other metals at an increased temperature, it is to be inferred that it existed in the greatest abundance in the earliest erupted rocks of this era. Let us consider a few facts: I have mentioned a gold-bearing specimen of soapstone. Some pioneer miners of my acquaintance inform me it is not unusual to find veins of gold-bearing magnesium rock in every way similar to ordinary quartz veins, only the difference in the gangue. These veins are usually narrow and pockety, and some of them are of extraordinary richness. One pocket was found to contain rough, scraggy plates of gold, the size of a man's hand, that exhibited no indications of attrition, and, consequently, could not have been deposited by aqueous agency. At Black Hill, W. G. Hidley recently discovered some veins of asbestus that were rich in gold and averaging about an inch in thickness and running through black serpentine rock. The magnesian casings of quartz veins are sometimes rich in gold. The blue gravel and cement deposits, which probably derive their peculiar character from decomposed magnesian rock, are proverbially rich in gold. Thus it appears probable that gold was erupted in the greatest abundance at the very outset of the metalliferous era, and, as the ores and alloys of gold are very numerous, we might infer that it was widely and generally diffused through the erupted rock of the old red sandstone period.

Whenever an upheaval occurred during the formation of the old red sandstone system, feldspathic granite, similar in composition to the eruptive rock of the clay slate period, was intruded along anticlinal lines, forming, in some instances, immense cones. Metal-bearing quartz was vomited from volcanoes which existed along these lines, while the stratum, estimated to be twelve miles in thickness, was being rendered plastic by loss of heat, and, consequently, the ores of all the useful metals known to man must have found their way to the surface during the old red sandstone period. If it is really the truth that ores were erupted identical in composition with those usually found in veins, and in such enormous quantities as the immense deposits of disintegrated quartz stained with the oxide of iron, forming the old red sandstone, would seem to indicate, it follows that the nobler metals enter more largely into the composition of the stratified rocks, and that placers are more widely distributed than has hitherto been supposed.

[To be Continued.]

**FRAUDS AMONG OREGON WOOL GROWERS.** Some of the Oregon papers are complaining very bitterly of frauds committed by wool growers in that State, who resort to various modes to increase the weight of their wool. In some cases the practice was carried to such an extent that the weight was found to lose from seven to thirteen per cent. when rendered fit for use. The manner of effecting this fraud is to sprinkle the fleeces with water. The evil of this fraud, says the Oregon City Enterprise, does not end by loss of weight, as the water, in connection with the natural grease, causes fermentation, which injures the strength of the staple, and causes it to be black yellow, instead of white, so that it can only be used for dark colored and inferior grades of goods. It is very certain that, if the practice is continued, it will destroy the reputation of the entire wool crop of the State. Oregon wool has been found to contain stones, and such like adulterations to defraud. If persisted in, the matter will return in loss account to the wool growers. It is not always that Oregon wool is inspected in San Francisco, and we should hate to see the clip of the State thrown out of the Atlantic markets on account of such tricks. If farmers think that they are not getting enough for wool, let them decline to sell it, but always keep it pure and unadulterated.

**"AN ITEM OF INTEREST."**—Computation of interest at 7.30 per cent. is a troublesome operation for many people who have never observed that 730 is just twice 365. To those who have observed the latter fact, it may also have occurred that 7.30 per cent. per annum is just two cents a day for every hundred dollars.

The new engine and pumps of the Chicago Water Works, with a capacity to raise 18,000,000 gallons of water per day, have commenced operations.

[Written for the Mining and Scientific Press.]

## Letter from Esmeralda.

AURORA, Aug. 20, 1867.

**MESSRS. EDITORS:** A few notes from this region, now that our prospects seem so encouraging, may perhaps interest you.

Messrs. Winters and O'Neil struck their ledge about the 25th July, and found it immensely rich. The rock was full of gold and small knots of native silver, both of which stuck out of it thick. They are about 1½ mile northeast of the Oxford Beta, and on the same lead. These gentlemen have a 16-stamp mill. Their experience has been rough, and to most would have been discouraging. Their perseverance, however, has met with its proper success. The deeper they sink, the better is the pay. They sunk fifty-three feet below the level which was worked on last fall, and then drifted to the lead, which they found some fourteen feet wide, well defined and very rich in gold and silver. There are about six feet of good pay ore in the lead, and some of it will pay \$1,000 per ton. It is calculated that the average will be about \$100 per ton. Winters and O'Neil are working from twenty to thirty men, and are taking out about sixteen tons good ore per day, enough to keep their mill steadily at work. When their steam hoisting works, now on their way from California, shall be erected, they will increase their laboring force, sink deeper, take out more rock, and lay off another level. This mine is valuable beyond dispute. Its success has restored confidence in the permanency of the mines in this vicinity, for this is the first claim which has struck pay at any depth, and which has been proven to be rich beyond a doubt.

Any number of mines as rich as Winters & O'Neil's, are to be found at and near Aurora. Capital and energy are the only requisites to their development. The Oxford Beta tunnel, on Silver Hill, has been steadily progressing for over four years. They have had much hard rock to contend with; but, judging from the reputation of the superintendent, Capt. Thos. Lytle, formerly of the Great Cape claim on the Yuha river, and the promptness with which its stockholders respond to assessments, work will continue whatever may be the discouragements until the ledge is struck. The Oxford Beta tunnel having run about 800 feet, has made an angle to cut the ledge (distant 80 to 100 feet) at right angles. They have already crossed two spurs containing pay ore, and, as their ledge is identical with that of Winters & O'Neil, it is confidently expected that when struck, it will be found to be rich.

B.

**SKILLED WORKMEN** are leaving England in large numbers for the United States. This is the right kind of importation. Every one of these workmen is worth 10,000 bushels of corn to the country. It is a great trouble to feed and clothe workmen and to have our shops so far from home. Over 1,200 iron-workers, mostly Germans, have quite recently arrived at Pittsburgh.

**POISONING BY EUPHORBIA.**—Several children were poisoned in this city, a few days since, by eating the berries of a species of this plant, which grows abundantly upon the hills in the western part of the city, and is even cultivated in gardens for the sake of its bright green color. It is to be hoped that this will serve as a lesson to those parents who have heretofore been unwittingly harboring an enemy, and that the dangerous ornament will at once be uprooted. All the species of Euphorbia are poisonous. The plant may be known by the fact that a milky juice exudes from a newly broken surface.

**MOLES** may generally be removed by means of a small surgical operation, in which either the knife or caustic is to be employed. Canterize them with lunar caustic or with potassa fusa. No one should undertake the operation without medical advice.

**DEATH OF AN INVENTOR IN AN INSANE ASYLUM.**—Our readers may recollect the "Cutting-Bromide Patent," to which we referred some months since, the claim embraced in which was for the use of bromide of potassium in combination with collodion in photography; and the validity of which was finally settled during the last fall. To those who remember the excitement which was occasioned among photographers throughout the country by the issue of that patent, and by the "test suit" which resulted, the following, from the Hartford (Conn.) Times of August 12th, will be interesting:

The death of James A. Cutting, at the Insane Asylum, in Worcester, is announced. Twenty-five years ago he was residing in Haverhill, N. H., in destitute circumstances, but by obtaining a patent for a new heehive, came into possession of enough money to have made him comfortable, had he remained there. He went to Boston, got up other patents and lost all his property. Finally, his attention was turned to the art of making daguerreotype pictures, then in its infancy, and he discovered the process of making ambrotypes. A patent was secured, and he sold rights in this country and Europe for many thousands of dollars. He was in the enjoyment of what was then considered a handsome income, some of which was spent in yachting. He was the owner of a handsome yacht, which he called the "Ambrotype." In these excursions he became acquainted with the habits of some of the residents of "the briny deep," which led to his establishing an aquarium in "an upper chamber" on Bromfield street, Boston. The public, attracted by the novelty, thronged his rooms daily, and it proved one of the most profitable as well as most entertaining of the places of amusement in the city. His success seemed to have turned his head, and he engaged in a much larger entertainment, the establishment of the Aqualia Gardens in Central Court, on the site now occupied by the Theatre Comique. How much money he spent and lost there is not stated, nor why the enterprise failed, but the establishment soon passed into the hands of P. T. Barnum. This was the last speculation of Mr. Cutting.

**PATENT BUSINESS.**—An examination of the work performed at the Patent Office, shows that the number of applications at the present rate of increase, will reach 20,000 during the present year, and that patents are being issued at the rate of nearly 300 per week. The applications have increased during the past four years on an average of nearly 5,000 per year, while the means for facilitating business have not been added in a proportionate ratio.

Our numerous patent clients will be pleased to read the following, which we clip from the American Artisan:

There is at last a prospect of the clearing up of the back work of the Patent Office. The Commissioner has now obtained a sufficient number of rooms in the Patent Office building to accommodate the authorized additional number of examiners, and has made the following appointments:—General Albin Schaeff, J. M. Thatcher, D. S. Stewart, L. Deane and N. Peters (five of the assistant examiners), and G. W. Gregory (a second-assistant examiner), have been appointed Primary Examiners. Messrs. A. P. Thayer, C. L. Coombs, G. A. Nolen, A. L. Hayes, C. Mygatt, J. C. Tasker, D. Curle, T. N. Bovee and E. Spear (nine of the second-assistant examiners), and M. C. Mitchell and J. S. Grinnell (temporary clerks), have been appointed Assistant Examiners. The commissions of these gentlemen have been signed by the Secretary of the Interior.

**CEMENT MILL BURNED.**—The Missouri Tunnel Company's cement crushing mill, at Yankee Jim's, was destroyed by fire on Saturday night last. Cause of the fire unknown. Loss estimated at from \$12,000 to \$15,000; no insurance.

**A SLEEPING CAR,** on a new plan, with the coaches arranged at a right angle of the track, has been introduced on the Pittsburg, Fort Wayne and Chicago railway. The car is sixty feet in length, and cost \$20,000.

**TALL HOUSE.**—There is now building in Paris an experimental house eleven stories high. It has no staircase, but the tenants are to ascend on a hydraulic elevator which goes up and down once in a minute. The sky parlors are the aristocratic rooms.

## Mechanical.

**ORIGIN OF CAST IRON MANUFACTURE.**—It is related that about the year 1700, one Abraham Darby, the proprietor of a brass foundry at Bristol, England, experimented in trying to substitute cast iron for brass, but without success, until the following incident occurred: A Welsh shepherd boy named John Thomas, rescued a flock of his master's sheep from a snow drift, and later in the same spring, during heavy rain and the melting of the snow, he swam a river to drive home a herd of mountain cattle. Having collected them, on his return he found the stream had increased to a boiling torrent. He nevertheless crossed it on the back of an ox, and brought home the whole herd in safety. As a reward for his courage, his master gave him four of the sheep that he had saved. He sold the wool to buy better clothing, and with the money obtained for the sheep, traveled to Bristol to seek his fortune. To prevent being impressed as a soldier, he requested his master to recommend him as an apprentice to a relative who was one of the partners of Abraham Darby, and he was accordingly sent into the brass works, until he could find better employment. As he was looking on while the workmen were trying to cast iron, he said to Darby, he thought he saw how they had missed it, and begged to try a method of his own. He and Mr. Darby remained alone in the shop that night, and before morning they had cast an iron pot. He was at once engaged to remain and keep the secret, which he did faithfully, although double wages were offered him by other parties. For more than a hundred years after that night, the process of producing iron castings in a mold of fine sand with two wooden frames and air holes, was practiced and kept secret at that factory, with plugged key-holes and barred doors.

**INVENTIONS OF WORKINGMEN.**—At one of the recent scientific discussions held in England, it was declared by Mr. Felkin, in illustration of the importance of diffusing scientific knowledge among the working classes, that since 1780 no less than 660 patents for inventions connected with the manufacture of lace had been taken out, of which all but some half-dozen were the discoveries of workingmen themselves, while in the last 14 years alone, machinery to the value of \$2,000,000 had been laid aside as no longer required for the attainment of the object in view. Mr. Babbage sat for two hours on the occasion of his visiting Nottingham, looking at a particular machine, by which some surprising results were accomplished, and in a reply to a question addressed to him, gave the reason of his narrow inspection of the machine, which was that, although effectual for its purpose, it had been contrived and put together by a man whose contrivances showed that he was no mechanic at all, but merely felt his way from stage to stage. In machines now in use in Nottingham, the same mesh which used to require sixty motions could now be made with six. And this was the result of the mechanical skill of workingmen, a fact not at all surprising to us, when we consider the fact that almost all the patents issued in this country are awarded to workingmen.

**STEEL IRON FROM CINDER PIGS.**—The manufacture of steel iron from cinder pigs, which has been for some time the subject of experiment, appears to be now nearly approaching a successful development. Mr. Heaton, of Langley Mills, places nitrate of soda at the bottom of the crucible, and covers it with a perforated iron plate. The iron to be purified is placed above this, and the melted nitrate of soda diffuses itself through the melted metal, producing, according to the statement of the inventor, complete desulphurization and dephosphorization. A number of experiments were made recently at Langley Mills with cinder iron, which would have been utterly useless in the Bessemer converters. The result is stated to have been the production of steel iron of the finest quality. A large Staffordshire firm is preparing to make the experiment on a large scale.

**STEEL RAILS** have been for some time past in use on the Hudson River railroad. The new track of this road, of steel, is laid from New York to Yonkers, and during this month a further section to Sing Sing will be completed.

For testing the different lubricating properties of oils and other lubricants, an English inventor has contrived an apparatus whose principle depends on the amount of frictional motion necessary to produce a given temperature.

**FIRST IRON FROM OREGON.**—The steamer *Montana*, which arrived last week, from Oregon, brought fifty tons of Oregon pig iron. As appropriate to this new industrial enterprise, we quote the following from the *Commercial Herald and Market Review*, of the 10th inst.:

It is with sincere pleasure we chronicle the commencement of a new and most valuable enterprise on the Pacific coast. In point of importance it will, if successful, yield rank to no other, and will fill the void so seriously felt at present. In the Merchant's Exchange, California street, is exhibited a pig of iron manufactured at the Oswego Iron Works, seven miles above Portland, Oregon, on the Willamette river. The iron is of the quality known as "charcoal iron," and has the appearance of being much softer, denser and finer than any imported. It is said to be fully equal to any made in the United States, being so pure, even in its prescut form, as to be capable of being run into castings for machinery as it comes from the furnaces. Iron is the most valuable of all the metals, and although its existence on this coast in vast quantities has long been known, no effort has been heretofore made for the reduction and utilizing of the ore. The "Oregon Iron Company" was organized and incorporated on the 24th of February, 1865, by H. E. Green, W. S. Ladd, and John Green. The capital stock was fixed at \$500,000, and was rapidly taken up by twenty stockholders, comprising some of the most sagacious and enterprising business men. At the present time the company is in full operation, their works being perfected and capable of turning out about twelve tons of pig iron daily. The total amount of assessments reaches only \$126,000, while the ore is said to yield 55 per cent. of iron, which is anywhere considered a rich return. One can hardly overestimate the value of this enterprise to the manufacturing interests of this coast. The capacity of the works, and the quantity of the ore, enable the manufacturers to supply nearly all the raw iron required for our present uses. The next Oregon steamer is expected to bring thirty tons of this iron. We learn that the proprietors intend furnishing a few tons gratis to each of the iron foundries in San Francisco, in order that they may give it the fullest and most thorough testing.

**THE USE OF STEEL IN LOCOMOTIVE CONSTRUCTION.**—The use of steel in locomotive construction is beginning to be more thought of than heretofore. There have been now at work for some years on the Maryport and Carlisle Railway several locomotives having steel boilers, fire-boxes and tubes, as well as steel tires, piston rods and motion bars; and there have recently been constructed for the Paris and Sceaux line, and for the Southern Railway of France, several engines with steel boilers. The use of punched steel gun barrels is rapidly extending, and the principle introduced by Messrs. Deakin & Johnson is being applied to other purposes connected with machinery. Bessemer steel is now beginning to be used for bridge construction, and it is stated that a recent French invention is likely to be able to compete successfully with the Bessemer process for the manufacture of steel. It may be accepted as a general belief that the age of iron is gradually passing away, and that in most cases where it is now employed steel will shortly take its place, as being both stronger and lighter.

**SUGAR AS AN ARTICLE OF DIET.**—Dutrone calls sugar the "most perfect alimentary substance in nature." Dr. Rush says it affords the greatest quantity of nourishment in a given quantity of matter than any other article in nature. Sir John Pringle tells us that the plague has never been known to visit any country where sugar composes a material part of the diet of the inhabitants. Dr. Cullen is of the opinion that the frequency of malignant fevers has been lessened by the use of sugar.

**WATER-TUBE BOILERS.**—The use of water-tube boilers may be classed as one of the inventions of the day, their increased strength and security contributing greatly to their popularity. Messrs. Howard, of Bedford, have recently tested their water-tube boilers to a pressure of 1,000 pounds per square inch.

**IMPROVED SOLDER.**—Deville has lately found that the addition of zinc amalgam to ordinary solder makes it applicable to aluminum bronze, and other alloys and metals, where the mercury in the amalgam could not be objectionable.

## Scientific Miscellany.

**THE EARTH'S CENTRAL HEAT.**—There is a very general belief, we might say almost a unanimity, among scientific men, with regard to the proposition that the earth was once a fluid molten mass, and that a large portion of its interior is still in an incandescent condition. The conclusions as to the thickness of the exterior crust, however, are so various that scientists differ in fixing the same all the way from fifty or sixty, to 2,000 miles or more. The conclusions deducible from chemical and physical causes, are also strongly supported by the astronomical calculations of William Hopkins, on the phenomena of precession and nutation, those of Thompson on the tides, and those of Pratt on the pressure of the mountain masses on the earth's surface, all of which conduce to the conclusion that the earth must have a solid crust 2,000 miles or more in thickness. The heat of the mass beneath the cooled surface is still nearly that at which the matter congealed; the loss of heat by radiation now proceeds very slowly.

**A NEW EXPEDITION TO THE NORTH POLE.** A committee of fifty-six persons, including Guizot, Chasseloup-Labat, Drouin de Lhuys, Henry Martin, and Michel Chevalier, has been formed in Paris for the purpose of organizing a new expedition to the North Pole. The route to be pursued is one discovered by a French hydrographer, M. Gustave Lambert, and has not been tried by previous explorers. A subscription has been opened for the expenses of the proposed expedition, which will be at least \$125,000, and it is announced that if the total of the sums collected by the committee does not reach that amount by the end of next July, all subscriptions will be returned in full. It is added that the Emperor has given his entire approval to the project.

**MUSCULAR FORCE OF INSECTS.**—An inquiry into the remarkable muscular force exhibited by insects appears to develop the following facts: 1st, Except in flying, insects have a much greater power of traction than *vertebrata*. Thus, while the draught horse can only exercise a force of traction, equal to two-thirds of its weight, the cockchafer can draw fourteen times its own weight. 2d, In the same group of insects, the smallest and lightest have the greatest power of traction. And those results, M. Plateau considers as not proceeding from muscles of a comparatively larger size, but from greater muscular activity.

**DISCOVERY OF A NEW PLANET.**—The telegraph announces that a new planet was discovered by Prof. Watson, of the Michigan University, on Friday night of last week. It appears that the discovery was made while that astronomer was making observations in the vicinity of the planet Neptune. The brilliancy of the newly-discovered planet is equal to that of a star of the 11th magnitude. It is situated in right ascension 14 degrees and fifteen minutes, and in declination 6 degrees and 10 minutes north.

**A SINGULAR "FIND."**—The Boston *Traveler* says that a rock weighing four or five pounds has been found imbedded in the earth, forty or fifty feet below the surface, on Fort Hill, by workmen. It is composed of quartz, iron pyrites, and a hard substance that resembles flint. As nothing like it can be found in Boston or vicinity, the question of how it came there is being discussed by amateur geologists.

The human body falls asleep by degrees, according to M. Cabanis, a French physiologist. The muscles of the legs and arms lose their power before those which support the head, and these last sooner than the muscles which support the back; and he illustrates this by the case of persons who sleep on horseback, or while they are walking. He conceives that sense of light sleeps first, then the sense of taste, next smell, and lastly, that of touch.

**CHANGE OF TEMPERATURE BY THE MIXTURE OF LIQUIDS.**—The following very important conclusions have been arrived at by Messrs. Bussy and Buignet in their memoir on the changes of temperature produced by the mixture of liquids of different natures. 1. In all cases under examination, with one sole exception, the calorific capacity of the mixture is a little superior to the mean capacity of the elements. 2. The liquids for which the increase of the bulk is the most considerable are exactly those which develop most heat at the moment of their union, such as ether and chloroform, alcohol and water, sulphuric acid and water. The only instance hitherto noticed of a diminution of bulk is in the case of the mixture of chloroform and bisulphide of carbon, whilst at the same time decrease of temperature takes place at the moment of the union. 3. Independently of the loss of heat resulting from the changes of volume, there exists a cause which produces an absorption of heat, which can be sometimes equal and even superior to the heat given out by the combination of the liquids. This cause is not quite clearly made out. It is suspected to be related to the phenomenon of diffusion.

**TUNGSTEN VS. THE BLACK DIAMOND FOR ROCK DRILLING.**—Our readers, says the *Journal of Applied Chemistry*, know that tungsten is a simple body of steel grey color, very hard, difficult of fusion, and of a density 17.6. It is found in combination with lime, as the tungstate of lime (scheelite), with lead, as the tungstate of lead (scheelite), and with iron and manganese (wolfram). M. Gaudin proposes the use of this metal for the drilling of rocks. Until now the black diamond has been employed, but the enormous expense of this substance has made a reform desirable. M. Gaudin prepares, in a flame of oxygen, a substance made from this metal, which is three-fold more brilliant than the ruby and will pulverize the hardest granite quite as readily as the black diamond. Emery has an action on the latter substance. Numerous experiments have shown that it can be obtained in any form and of any dimensions without alteration. This preparation may be used to drill granite mountains, and to work tempered steel. It can also be used to turn white cast iron. This discovery is very important, and is calculated to render immense service to industry.

**MINERALS AT A HIGH TEMPERATURE.**—The behavior of some minerals at a high temperature has been studied by Dr. Elsner. He has heated a great variety of minerals and other rock constituents in a porcelain furnace to an estimated temperature of 2,500° to 3,000°, and finds in general that silicates containing the alkaline metals, or iron, are much more fusible than those which contain much alumina, or no iron; with the exception of obsidian, all the rocks experimented upon, even those of volcanic origin, presented, after heating, totally different characteristics from those which accompany them in nature. The crystalline varieties became compact and semi-fused; therefore he says they must have been produced in nature under different conditions from those of his experiments. The conversion of pumice into an obsidian-like body is especially interesting. After heating, the rocks experimented on showed lower specific gravities.

**CARBOLIC ACID FOR EXTERMINATING MOSQUITOES.**—A correspondent of a New York paper writes that carboic acid has recently been successfully used, near Rahway, New Jersey, for the extermination of mosquitoes and flies. A small piece of cloth, saturated with the acid, was hung up in a room, and in two hours the flies had entirely disappeared. In the evening the acid was tried in the kitchen, where the mosquitoes were very troublesome, with like success. This remedy is worth trying, especially in the mosquito infested region of this State.

**PROF. AGASSIZ** and a Harvard class of pupils, it is reported, contemplate a visit to Southern Ohio, for the purpose of a scientific investigation of the antiquities—tumuli, fortifications and other remains of an extinct race—in which that section so greatly abounds.

**A VALUABLE** bed of amber, has been found at Ferdinand, Dubois county, Indiana. The deposit is extensive and easily worked, and the quality excellent. Amber has hitherto been found only in very limited quantities in this country.

**PROF. S. P. LANGLEY**, who is now connected with the United States Observatory at Annapolis, has been elected to the chair of Astronomy and Physics at the Western (Penn.) University.

POEMS: BY CHARLES WARREN STODDARD. We have received a copy of this book from the publishers, Messrs. A. Roman & Co.

To review a book of poems is no trifling matter. Few men are equal to it. A genuine poet should only be reviewed by a genuine poet. No other can sympathize fully with him. The heart-strings of ordinary men are not tuned with such delicacy as to vibrate promptly to such influences as those to which the poet's soul responds. He is sure, therefore, to be misunderstood by most of his readers. A few instinctively recognize the poet, although they know not wherein his power lies. Much less are they capable of putting into words—clumsy vehicles of thought as they are—the secret of that power.

The reviewer's office is a grave one. He may, by ill-considered approbation, urge on unfounded hopes to a more cruel disappointment; or, he may blight by harshness, a bud of promise, which, encouraged, might blossom into richness. Poets are sensitive plants; yet not all are crushed by being trodden upon. The youthful Byron, smarting under the flippant pen-strictures of the presumptuous Jeffrey, lashed right and left with the wrath of a young lion, who, conscious of his own power, was determined that his hopes of future fame should not be crushed out by the braying of asses. Some, who are made of less stern stuff, succumb, and are no more seen of men.

It is, then, with the utmost diffidence that we undertake the duty of reviewing a book of poems—more especially when it is a "first" book. In the case before us, we hardly know what to say. Our young friend has evidently wooed the muse with assiduity. At times he seems to have caught her ear, and a happy conception or a felicitous expression is the result. But there is often a crudeness of imagery and a failure to sustain the figure, which shows that his verse does not yet flow with that spontaneity with which the "seer," impelled perforce, indites "thoughts that breathe" in "words that burn," and draws a vivid picture with words each one of which is a picture in itself. Although our author plainly delights in the excitement of composition, it is too often labored. As he says in his opening invocation to "Poesy"—

"I wrestle with my spirit's mirth, In travail with a poem's birth. When chasing eares are wearying, With all my life to thee I cling, Believing I was born to sing."

But we prefer the more grateful task of dwelling upon the merits, rather than what appear to us the faults of the book. "Through the Shadows," is to us one of the most pleasing "morsels" of the volume. In the twilight, with the murmur of the tropic sea as it "ripples" upon the distant beach, while the "glimmering stars in their glee" listen,—

"Quiet is coming and folding Our troubles away; and our woes Are hushed in the cool, fragrant shadows Like bees in the heart of a rose."

This is certainly poetry, so far as this portion of the picture goes. But there does not seem sufficient reason for speaking of the sun as sinking, bleeding, into a coral grave; while in the next breath "sunlight" is spoken of as a butterfly which has flown "out through the mist and the vapor," "brushing the gold from its wings." The single gem which we have quoted, however, will atone for such sins. We think the poem shows traces of recent reading, both of Longfellow and Tennyson. We cannot resist the temptation to quote a stanza from the former, in "The Day is Done"—

"And the night shall be filled with music, And the ears that infest the day Shall fold their tents like the Arabs And as silently steal away."

And does not— "Come on little stars all silver, For the terrible sun has gone," etc., remind one of— "Shine out, little head"— in Mand?

The taste which suggested the meter in which the lines "At Pollock's Grave" are written, is unexceptionable. It is especially suited to the broken utterance of grief—too deep for long-drawn and elaborately-rounded

verse—hushed, as befits a poet's sacred resting-place.

In "My Little Love," these lines— \* \* \* "the feathery fragrant showers Of snow-white blossoms drift upon the grass, Kissing her whispering footsteps as they pass," have a quiet sweetness worthy of Keats. "The First Rain," is a good picture; except for the incongruity of the metaphors in the second and third lines, it is graphic. But— \* \* \* "phantom flocks of snubbeams \* \* \* With gilded feathers of the butterfly," is bad; and herein is, we think, one of our author's failings. But our space will not allow of further remark. We do not profess to have given all that is worth giving.

The book is exquisitely printed, and embellished with just enough of delicate and appropriate cuts, drawn and engraved by Mr. Keith. As regards the "getting-up," nothing could be more perfect. The paper is pure white. We rejoice over this fact, as an indication that the "tinted" style—to our mind of questionable taste—is exploded.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

67,427.—MODE OF PRESERVING EGGS.—P. Gaughran and L. Sweeney, San Francisco, Cal.:

We claim treating eggs for preservation substantially in the manner as herein described.

67,501.—GANG PLOW.—Allen T. Covell, San Leandro, Cal.:

I claim, 1st, Attaching the beams, A, A, to the pole, B, between the reacher, a, a, by the rod, C, so that the plows may be made to move up and down, swinging on the axle, J', and rod, by operating the lever, G, when disengaged, substantially as described.

2d, Attaching the axle, J', and axle-head, J, angularly to the frame, the clips, K, K, and adjusting blocks, l, l, substantially as described and for the purpose set forth.

3d, The links, D, D, attached to the beams or frame, and the rigid arms, E, E, of the roller, operating in them in combination with the beams, A, A, and pole, B, substantially as described.

4th, The construction, arrangement, and combination of the beams, A, A, pole, B, reaches, a, a, rod, C, axle and axle-head, J and J', temper blocks, l, l, roller, F, and arms, E, E, together with links, D, D, substantially as described and for the purposes set forth.

67,546.—MEANS FOR REEFING TOPSAILS.—Fridolf Höök, San Francisco, Cal.:

I claim the crutch, g, attached to the lower topsail-yard and its friction rollers, n, n, together with the segments, d, d, moving on said rollers and attached to their sides, s, s, substantially as and for the purpose described.

67,782.—WAGON SPRING.—E. P. McCarty, San Francisco, Cal.:

I claim 1st, The elastic hall C, suspended or held in place, by the rod D, between the upper and lower portion of the spring, substantially as and for the purpose described.

2d, The metal cups, BB, or their equivalent, for receiving the ball and supporting the springs substantially as described.

RECENT INVENTIONS.

A NEW AMALGAMATOR.—The Columbia (Oregon) Citizen describes a new amalgamator recently invented by Messrs. Foreman & Mattison, as follows: It consists of an upright cylinder, into which is inserted a pipe extending to within 1 1/2 inches of the bottom. The pulp, as it comes from the battery, is conducted into this pipe through a hopper. A jet of steam is directed into the pipe in the bottom of the hopper, which forces the quartz through the same into the quicksilver in the bottom of the cylinder. The action of the steam heats the quicksilver, and brings the gold into contact with it, whereby it is saved. The cost of the arrangement does not exceed \$40.

CUTTING METAL.—An improved implement for cutting pipes and bars of metal has been invented by Mr. Wolstenholme, of Redclyffe, Lancashire. It consists of a revolving circular cutter, upon a suitable slide. The pipe or bar to be cut is securely held in a vice or otherwise, and the circumference of the cutter is brought against the pipe or bar by means of a screw passing through the lower end of the slide. The implement is then turned round by the handle forming the continuation of the screw, and the cutter is set up by the turn-

ing of the screw. By this means the cutter gradually penetrates into the metal, until the pipe is cut asunder, or the metal bar is sufficiently indented to enable it to be broken.

AN INGENUOUS BULLET DETECTOR.—A very ingenious piece of mechanism for the detection and extraction of bullets in wounds has been devised by Mr. Sylvan De Wilde. The probe, consisting of two steel wires insulated from each other, is connected with an electric horseshoe magnet and a bell, and when (introduced into the wound) it touches the bullet the circle is completed and the bell rings. The forceps act on the same principle, and are intended first to detect, then to seize the bullet. The points of the probe are kept sheathed on introduction to a wound, and not uncovered until the supposed bullet is felt. This is effected by means of a sliding tube. Mr. De Wilde's probe is a sensitive artificial finger, which enters deeply into the tissues, and gives the signal at once when it detects the hidden source of mischief below.—London Lancet.

The *Alta* of the 10th inst., thus describes a combination lock, invented by Theodore Kromer, a young watchmaker in the employ of Tucker & Co.:

It contains no spring whatever, is exceedingly simple, the tumbler bolt and a lever-piece being all that is to be seen inside, and occupies little more space than a common door lock. It has no key whatever, can be readily adjusted to the required combination by anybody, and has no opening through which powder or any other substance can be introduced to destroy it. One million changes or combinations can be produced by simply turning the knob. The cost of a lock suitable for the door of a first-class residence, and admitting of ten thousand changes or combinations, on a modification of this plan, Mr. Kromer estimates at \$10.

The *Call* of this city, thus describes a dove-tailing machine recently invented in this city by Elander Heath, one of the workmen in Hobbs & Gilmore's box factory: The invention consists in a series of circular saws, set in a peculiar manner, and they perform the work of cutting the joint so quickly that one is perfectly astonished. The joints are close fitting, and remarkably strong, and the machine so simple that any boy can attend it. We timed the inventor while he made a box twelve inches long and eight wide, and found that from the time he took the board in his hand until he handed us the box he was occupied just three minutes. The machine will cut the dove-tails in the four pieces in less than a minute, and they can be put together in half a minute. These machines can be built for about \$250 in gold coin.

COPYRIGHTS.—The following copyrights have been entered in the U. S. District Court of California since Sept. 3d, 1867: By A. B. Bowers, second edition of "A Map of Sonoma County, California, made and published by A. B. Bowers, in accordance with an Act of the Legislature approved 28th March, 1863, with additions and corrections to September 1, 1867," by Charles A. Tuttle, a book entitled "Reports of Cases Determined in the Supreme Court of the State of California," Charles A. Tuttle, reporter, vol. 31, S. F.; by Mrs. R. L. Jones, of Sacramento, "A Ladies' Diagram, an improved invention for cutting ladies' dresses, basques, sacks, and children's clothing;" by John S. Hittell, the third edition of a book entitled "The Resources of California;" by Lawrence & Houseworth, a book entitled "California Scenery, a series of Stereoscopic Views," etc.

BUSSEY'S IMPROVED COMBINATION SAFE LOCK.—The many advantages of this lock are fast recommending themselves to those who wish a lock in which they can place implicit confidence. Their simplicity, compactness, and ease of management, are points which do not fail to recommend this as the best, and, in the end, the cheapest lock for merchants, bankers, and all persons having valuables for which they wish a secure place of deposit.

HENDY'S CONCENTRATOR, AGAIN.—The Empire Mill Company, at Grass Valley, having tested the merits of this machine to their satisfaction, have ordered five more from the Union Foundry. In addition to this, three have been shipped during the past week from the Pacific Foundry for the Lucy Mining Company, Owyhee District, Idaho.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY.

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytic. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Steel.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—E. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Deanna.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Schlags.

I recommend it to all those who wish to obtain a book that will give them definite ideas on the subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as respects pleadings and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. \* \* \* Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Bouie.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so solid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has gone the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

His design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an one in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

PRICE, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address HEWEY & CO., Mining and Scientific Press, San Francisco. 6v15-1f

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, September 14, 1887.

City Stocks.

The dealings in city shares have been light, and in the Board were confined to the following: Spring Valley Water Co. at \$67 50. The usual dividend of 1/4 per cent. is payable since the 10th inst. Gas stock at \$66 50 @ 67. North Beach and Mission Railroad is lower, selling at \$50 @ 50 50 per share, owing, no doubt, to the fact that they did not declare the usual dividend for the present month.

Gold opened yesterday in New York at 145 1/2, and closed at 141 1/2. Legal Tender Notes sell in this market at 69 1/2 cents.

The Bank of California will pay its usual monthly dividend of 1 per cent. per month on the 16th inst.

The Builders' Insurance Co., at its annual meeting on Tuesday, elected the following officers: President, C. T. Hopkins; Vice-President, H. B. Tichenor; Directors, Samuel Merritt, A. J. Pope, Jerome Lincoln, Frederick Castle, Judah Baker, Charles Mayne and Peder Sather. From the annual report we take the following: Capital, \$200,000; assets, \$297,000; receipts for the fiscal year, from all sources, \$184,924 40; losses paid, \$69,376 56; dividends paid, \$48,000; expenses, \$18,203 80; taxes, \$10,573 39. This company's business is now confined to Marine risks. The stock is quotable at \$1,400 bid, and \$1,500 asked.

The Builders' Insurance Co. held its first annual meeting on last Wednesday evening. We condense the following from its balance sheet: Receipts—Capital, \$44,791; premiums, \$130,070 98; interest, \$4,390 21; State tax, \$3,000 33. Disbursements—Losses, \$34,063 67; brokerage, \$10,931 86; other expenses, \$28,775 22; assets, \$108,481 77.

Mining Share Market.

The mining share market has been quite active during the period under review at greatly depressed rates. The operations in several leading stocks have been very heavy, a large proportion being sold short. The "bears," evidently, have complete control of the market, and the effect of this action is noticeable throughout the entire list. The bullion returns from eleven different claims on the Comstock lode during the month of August amounted, in round numbers, to \$1,200,000 against \$1,220,000 in July. In these aggregates we do not place the yield of the Yellow Jacket Co., the information not being accessible.

HALE & NORCROSS—sold early in the week at \$2,000 seller 30, declined to \$1,500 s 30, and closed Thursday at \$1,500 e 30. The hoisting works at the new shaft, it is confidently expected, will be completed during the present month. The shaft has now reached a depth of forty-four feet below the 780-foot level, and after sinking upwards of seventy-five feet further, or at about 900 feet, a new level will be opened. The actual returns of bullion made by the mills for the month of August show an excess of \$3,086 over the 65 per cent. yield reported last month, the total amount being \$124,664 69. A dividend of \$125 per foot will be payable on and after the 16th inst.

SAVAGE—brought a host of purchasers into the market under the very marked recession which this stock experienced during the past week, falling from \$200 to \$135 per share, a decline of \$1,300 per foot, rallying to \$156, receding to \$149 50, and closing at \$135. The sales during the week at the regular session of the Board foot up 4,364, which at an average price of say \$150 per share will show the transactions in this stock to have amounted to \$654,600. The cave in the north and middle mines, on the seventh level, which produced the rapid decline in the stock, it is believed will require about one week's work to clear away, and will not interfere with the yield of ore for the present month. The amount of ore extracted during the week ending September 7th, is nearly 300 tons less than the product of the previous week, and is due to the anticipated cave, making it dangerous to work in the wide excavations on the eighth, ninth and tenth floors. The shaft has attained a depth of over fifty feet below the fourth station. From all accounts the breasts of the various drifts show no important change. On the 1st instant this company had 3,900 tons of ore at the mills and dumps, and during the month of August they reduced 9,147 tons, showing a yield of \$327,937 in bullion. The expenses were as follows: Mine, \$43,844; incidental,

\$10,582; reduction, \$134,128, leaving a profit of \$190,381. The average yield was \$41 31 per ton and cost of production and reduction \$20 61.

CROWN POINT—has been less active at declining rates, opening at \$945, gradually receding to \$820, and closing at \$775. The north drift from winze on the 600-foot level, at a distance of twenty-five feet below said station, was reported to be in excellent ore on the 8th instant, and telegraphic advices of the 11th say that the "drift north from the winze continues good."

The south winze from the same level is down nineteen feet, and is said to look well at the bottom. The shaft is down sixty-six feet below the 600-foot level. During the month of August 2,081 tons of ore were reduced, showing a yield of \$54,291 85, or \$26 08 per ton. The expenses during the same period are given at \$85,000, leaving on the 1st inst. a cash balance of \$10,000 in the treasury. They have supplies at the mine valued at \$30,000.

CHOLLAR-POTOSI—rose from \$428 to \$437 50, fell to \$345, rallied to \$376 @ 387, and closed at \$369. We have nothing of importance relative to the old works. The ore from the west drift on the Blue Wing level averages \$17 per ton by assay. Preparations are being made to place the pump at the fifth station of the new shaft, (about 900 feet in depth) after which this station will be opened by drifting westward and running the main drifts north and south. The ore ship of the 13th instant records the delivery of 341 1/4 tons of ore to thirteen different mills. During the month of August 12,417 1/4 tons of ore were reduced by the custom mills, showing an average yield of \$28 57 per ton. The bullion returns for the same month reach \$350,000. A dividend of \$25 per share is payable to-day.

GOULD & CURRY—The rapid decline of this stock at the close of last week was due to the levying of an assessment of \$25 per share, or \$100 per foot. During the present week the stock rose from \$307 50 to \$325 per foot, declined to \$300, then sold at \$325 @ 310, and closed yesterday at \$310. Since the close of the year 1861 no assessments have been levied by this company, but prior to that period the following were collected:

Table with 2 columns: Description and Amount. Includes Levied Dec. 22, 1860, Levied June 21, 1861, Levied Aug. 24, 1861, Levied Nov. 5, 1861.

Makes a total of \$291,699

From a statement published by us in January last we reproduce the following figures: The bullion yield of this company from July 1, 1860, to November 30, 1866, amounted to \$13,626,871, and the dividends disbursed during the same period aggregated \$3,778,800. This enormous yield was obtained from 230,546 tons of ore, including over \$900,000 obtained from tailings. During the present year the yield of bullion has only been about \$375,000. The upper works of this mine continue to return from sixty to seventy tons of ore per day, which is reduced at the company's mill. We have nothing encouraging in regard to the prospecting carried on in the lower levels.

OVERMAN—has been to a great degree inactive, selling at \$65 @ 57 50, then at \$67 50, and closing at \$63. On the 12th inst., the mine was reported to look well, both on the 300 and 400 feet levels, and it is thought that the quantity of ore will be considerably increased during the present month. On the 9th inst., a bar valued at \$2,153 69 was shipped to the office in this city. During the month of August the bullion yield amounted to about \$20,000. The ore statement for the present month to the 10th inst., shows that 834 tons were reduced, and that 318 tons remained on hand at the mills at that date.

EMPIRE—has been in the market at \$175, buyer 30. The bullion returns in August amounted to \$22,333 80 against \$25,000 in July.

SIERRA NEVADA—sold to a considerable extent at \$13 @ 14, closing at \$7 50. Nothing of an encouraging nature has yet been developed by continuing the lower drifts of this mine. An assessment of \$10 per share was levied on the 14th inst.

IMPERIAL—met with considerable inquiry, opening at \$152 50, receding to \$135, then selling at \$142, and closing at \$135. The first clean up of the Rock Point mill amounted to \$14,103. The 371-foot level yields a better quality of ore, and it is believed that the bullion returns for the current month will show an increase over the returns made in August.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,768,785.

OPEN AT LAST!—The Century Plant, at Mr. Potter's grounds, Oakland, is now in blossom. The ladies of the First Congregational Church, in that place, have prevailed upon the proprietor to allow the grounds to be open for visitors for a limited time. The proceeds will be for the benefit of the Church.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

CARSON HILL UNION M. Co.—Calaveras county, Cal. Sept. 10th. Capital stock, \$50,000; 500 shares, \$100 each. Trustees: John McManus, Robert McMillan and Cortland Wood.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DAY OF MEETING, DATE OF DELINQUENT SALE. Lists various mining companies and their financial details.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

S. F. STOCK AND EXCHANGE BOARD.

Table with columns: Bid, Asked. Lists various stocks and bonds with their current market prices.

Table with columns: Bid, Asked. Lists various gas companies and railroads.

Table with columns: Bid, Asked. Lists various banking institutions.

Table with columns: Bid, Asked. Lists various insurance companies.

Table with columns: Bid, Asked. Lists various mining stocks from the Washoe District.

Table with columns: Bid, Asked. Lists various flour and grain products.

Table with columns: Bid, Asked. Lists various sugar and coffee products.

Table with columns: Bid, Asked. Lists various oil and other commodities.

San Francisco Metal Market.

PRICES FOR INVOICE.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

Table with columns: Bid, Asked. Lists various metal prices including iron, steel, and copper.

INOGENUOUS MECHANISM.—By the last steamer was received a clock which has figured during the summer at "L'Exposition."

Besides the mean time of San Francisco, the hands are made also to indicate the solar time in different countries, by means of human figures representing the different races delineated upon a separate disc or face. It is on exhibition at 605 Washington street.

By MAIL.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pitts, San Francisco. 2x15

ELECTROTYPING, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Sept. 7th: Mr. J. P. Ray received orders this week from parties owning the mine in New York to start up work on the Merrimac claim situated below town. The claim is on the belt of quartz lodes of which the celebrated Florence and the Manchester are best known, and for which the Winchester tunnel is running to strike deeper in the hill. It was recently sold to New York capitalists by the old locators, through Mr. D. G. Wilson, of Tarshish memory. The Merrimac promises well, and is well worthy the free expenditure of money to open it. Mr. Ray puts in two shifts on Monday.

The workmen in the cut being run across the lode from the north drift in the Tarshish mine 90 ft. from the main tunnel, have struck first and second class ore, proving conclusively that the Tarshish is all that we have claimed for it, one of the big mines of the world.

We learn from Judge Reed, that the lower tunnel of the I. X. L. mine is developing a fine large body of ore, that hopes are entertained that the company will soon be able to fill the contract of 100 tons of first class ore they have entered into, the same being, it is said, now in sight.

## Calaveras County.

The editor of the *Chronicle* seems to be getting out of patience with the slow enterprise of miners in that county, and endeavors to stimulate its capitalists to put forth some effort to redeem its mines. He says: While our neighbors are progressing in wealth and population, Calaveras appears to be at a standstill, with the exception of our copper lodes, which are being extensively worked. All other kinds of mining seems to be paralyzed. The quartz ledges of Amador are attracting capital and enterprise, while the lodes of this county, only a few miles distant, are languishing for want of the means necessary to develop them. Calaveras has long been celebrated as a mining county. While the precious dust could be easily extracted from placer diggings, or be got by running into the mountains, immense quantities of gold were taken out; but the very moment that capital, patience and perseverance are required in order to render our quartz ledges profitable, there seemed to come over all a perfect stagnation; and while other districts have gone forward, we have laid supinely on our oars waiting for "something to turn up." We have too long looked for foreign capitalists to open our quartz ledges. Let us open them ourselves, and then look to outside capital for the means to work them.

## Nevada County.

*Gazette*, Sept. 7th: The Ancient River Channel and Blue Gravel Mining Co., at Bear Valley, are now down 55 ft. The sinking is entirely in a deposit of hard gravel interspersed with boulders, some of them tons in weight, rendering blasting necessary. From the position of the boulders, the manner in which they are worn and the drift of the sedimentary deposit, it is evident that the channel runs directly across Bear Valley, is of older formation than the present valley and entirely distinct in its drift from the course of the present surface stream. The company are sinking to find the bedrock, or bottom of this ancient channel. How far they will have to go to reach the bedrock it is impossible to ascertain from the surrounding geological appearance of the country. It is estimated, however, that it cannot exceed 200 ft. from the surface of the valley.

Sept. 9th: R. C. Black has sold one-half of his interest in the Black & Young mill and mine, between the Star mill and Eureka. The sale comprises one-third of the entire property. James F. Irwin, of Louisville, Kentucky, is the purchaser, and the amount paid \$20,000 gold. The ledge comprises 2,000 ft. of ground. A tunnel into the hill 400 ft. taps the ledge, which is developed by a drift or tunnel on it to a distance of 400 ft. more. The ledge is in excellent condition for the rapid extraction of ore. The mill employs 10 stamps, and has already crushed over 1,500 tons of rock, that has paid its owners handsomely.

The Banberry Co. have had 80 tons of rock from their ledge crushed at Black & Young's mill, yielding \$1,700—or over \$21 per ton. The total cost of mining, hauling and crushing was \$7.50 per ton—leaving the net profit \$13.50 per ton, or nearly 200 per cent. over and above expenses. This company are now getting out another lot of 300 tons, to be crushed at the same mill.

The Commercial mill will go in operation some time next week. It is run by steam

power, has 10 stamps, is supplied with Hendy's concentrators, and is fitted up with all the modern improvements. The proprietors of this mill own the Veatch & Powell ledge, located near by.

The Birchville Co. are now putting up a 5-stamp steam mill on their claim. Rock from this ledge has been crushed in arrastras, at Eureka, and yielded well. A lot of 100 tons, worked at Black & Young's mill, gave a return of \$3,400—\$34 per ton.

A company of San Francisco capitalists have recently purchased the Booth mine, near Eureka, and are putting up a whim to sink and raise rock. They have purchased of Cochran & Black the Mohawk ledge, near by, for \$1,500. But little work has been done on this claim, but it has external indications of its value. This same company own the Snapp ledge, which is opened by a tunnel 755 ft. in length.

It is reported that D. W. Snapp, of Eureka, has bought Lambert & Co's mill, that was crushed down and severely damaged by the snow last winter, and will have it repaired and ready for business in a few weeks.

Patrick Mulligan & Co. are about to have 200 tons of rock from the Golden Age ledge, crushed at Black & Young's mill.

The Reasoner Bros. have out 150 tons of ore from their claim, which is to be worked at Black's mill.

Grass Valley Union, Sept. 7th: We yesterday saw a sulphuret bar from the New York Hill mine, worked by Deetken, which is valued at \$4,813.40. The bar was the result of 22 tons of sulphurets, showing a yield of \$219 per ton.

EXCELSIOR.—Virginia (Nev.) *Enterprise*, Sept. 5th: The old wheel crushers in the mill of the Enterprise Co., Meadow Lake, are being replaced by stamps; a 30-ton roasting furnace is being erected. Workmen are engaged in raising ore, and a force of men are at work getting out a supply of fuel for the winter. The mine is looking better than ever, and the chances are that the Enterprise will again yield a profit to the stockholders.

Sept. 7th: We were yesterday shown a bar of gold bullion from the Mohawk and Montreal mine, Excelsior District, just sent in from there. It was molded and assayed at the office of George Dorwin, assayer, in this city. It weighs nearly 59 ounces, and contains: in gold, \$775.17; silver, \$13.85—total, \$789.02. This return is very flattering, being the result of the working of a small lot of sulphuret ore by way of experiment. The general run of ore from the mine pays over \$30 per ton in free gold, that amount being taken from the amalgamated copper plates over which the pulp is made to pass, without taking into account that which will be found in the battery and pans. The sulphurets in the tailings are carefully saved for future treatment. The mill has not been very regularly at work of late, owing to the difficulty of getting the ore to it from the mine; this difficulty, however, will soon be obviated by means of a railway now being constructed.

Meadow Lake *Sim*, Sept. 7th: The Eclipse Co. are taking out some very rich ore, 50 tons of which they intend to have crushed at the Mohawk & Montreal Co.'s mill.

The Green Emigrant Co. have employed the California mill, which they are now running. They have a large amount of ore on hand.

*Gazette*, Sept. 11th: We were shown yesterday, by John Pattison, the superintendent, some fine specimens of gold bearing quartz from the Cunningham mine. The specimens were taken from the bottom of the incline now being sunk, and contain much free gold and sulphurets.

## Placer County.

*Herald*, Sept. 7th: A couple of miners working a quartz claim near North Ravine, recently made a rich strike. We are informed they took out one piece of quartz which is estimated to contain \$1,500 worth of gold.

*Transcript*, Sept. 8th: One hundred tons of rock, worked from the Grizzly ledge, Devil's Cañon, yielded \$10 per ton.

*Alta*, Sept. 11th: The Missouri Tunnel Co's gravel mill at Yankee Jims, was destroyed by fire on Saturday night. Cause of fire unknown. The loss is estimated from \$12,000 to \$15,000. No insurance.

## Plumas County.

Downville *Messenger*, Sept. 7th: We understand that fine prospects are being obtained on Squirrel creek, near Jamison City, Plumas county, and that extensive preparations are being made to work the mine to advantage.

## Shasta County.

*Courier*, Sept. 7th: R. J. Holmes recently took two lots of ore, from the Crystal ledge, to the celebrated San Francisco assayer, Mosheimer, who reduced the rock, with the following result: Lot No. 1, from croppings,

\$42 per ton in silver, and \$5 in gold. Lot No. 2, from rock taken from the shaft, 30 feet from the surface, \$103.20 in silver, and \$5.50 in gold.

The excitement in regard to the newly discovered placer mines on First creek, near Pittsburg, has subsided, as there is not sufficient water in the creek to run sluices. The ground prospects rich, however, and claim holders think they will take out large quantities of gold dust when the rainy season sets in.

A miner's meeting, held to consider the propriety of admitting Chinese into the Buckeye mining district, took place at Buckeye, Aug. 24th, when the question was decided in the negative.

The coal vein near Round mountain has increased in size, and continues to grow wider as it is sunk upon. The quality of the coal is said to be equal to any yet discovered on this coast, and the Red Bluff blacksmiths, who have tested it, are anxious to secure an interest in the mine.

A gold nugget, weighing near \$1,000, was lately found on Dog creek, and is now on exhibition at Red Bluff.

## Sierra County.

Downville *Messenger*, Sept. 7th: The Monumental Co. at Potosi, has just made the connection between the shaft and tunnel, and will be prepared for blasting in a few days. It is believed that this claim will compensate for the loss of both the Pittsburg and Hawkeye, and when fully opened times will be livelier than ever before in that locality. The Hawkeye and Pittsburg are still prospecting, and will, perhaps, after awhile be taking out gravel of usual richness.

The Down East claim, which for a time ran considerably below wages, is again doing well.

A friend from Mohawk Valley, engaged in prospecting the new mines recently discovered there, informs us that prospects are bright. There are five companies working, who make good wages working with a ton. The diggings are surface, and the gold coarse.

## San Bernardino County.

*Guardian*, Sept. 17th: The operations on Lytle creek are spoken of in the most encouraging and appreciative manner. It is well known that there is a great breadth of country in that vicinity, evidently of a gold bearing character; that wherever this ground has been prospected, gold has been found; and it is thought that if water could be brought on the land in quantities sufficient for ground-sluicing or hydraulic mining, not only would the water pay, but all this ground would be made tributary to the labor of man.

## ARIZONA.

*Gazette*, Aug. 21st: Mr. Beardsley, and others, are putting up a water wheel on the Hassayampa, with power to run several arrastras, to crush rock from mines in that vicinity.

Mr. Robert Groom, and others, discovered a silver bearing lead a short distance from the Sterling mill, some weeks ago. They sunk on it eight or ten feet, and took out about a ton of rock, specimens of which have been assayed by Mr. F. A. Cook, and yielded very largely.

The Virginia *Trespass* of (Sept. 7th, has the following from an old Californian, concerning a ledge in which he owns an interest, and which he and others are trying to perfect machinery for working, he says: The leads are 7 ft. 2 in. wide, with occasional masses of solid sulphurets. The rock concentrates about 40 per cent. of sulphurets, that averages \$500 per ton. There is also about \$10 per ton of free gold in all the rock. There is an abundance of wood and water at the mine; so you can see what my prospects are. The prospects of the country are anything but bright. Principal cause, Indians. They have stolen the whites poor, and although Uncle Sam has been trying for three years to do something with them, they are worse and more numerous than ever.

## COLORADO.

Georgetown *Miner*, Aug. 22d: The Philo Scoville lode appears to be rich, and continually grower richer.

The editor has seen a piece of ore that had been roasted in a stove, perfectly spangled, throughout, with globules of silver. The ore was from the Dixou lode, Republican Mountain. The crevice is four ft. in width, showing a fine vein of sulphurets.

The New Boston lode, under the development it is now receiving, is showing the best body of galena ore ever found in the district.

Many parties from the east are now here, examining our resources. The richness and extent of our mines astound them.

On Monday last we saw some very fine ore from the Cashier lode. The ore vein in the Cashier is 13 in. in width, carrying ga-

lena and sulphurets of iron combined with zinc blende. The ore assays from \$150 to \$800 per ton.

In Gold Run they have struck a large body of pay dirt, that is yielding free gold in fabulous quantities.

While selecting ore for milling at the Hunkadora lode last Saturday, we found a couple of specimens bearing native silver.

The Herkimer lode is yielding large quantities of very rich ore.

The Silver Star lode at Gray's Peak, has an 18-in. ore vein, composed of galena and silver sulphurets, that show by assay \$350 per ton. The Flying Cloud lode presents an 8-in. vein, averaging \$420 per ton. Ore from the Monitor lode assays \$125 gold, and \$75 silver per ton. The Anglo-Norman lode has a crevice 30 in. wide, with a 16-in. ore vein of sulphurets. This mine has yielded considerable ruby silver and crystallized sulphurets, that has shown by assay from \$22,400 to \$27,000 per ton.

*Times*, Aug. 27th: The Briggs Co's mine has been improving of late. Their 50-stamp mill is kept steadily at work on ore from the Briggs lode.

A new silver lode has been discovered about a mile east from Lyon's works, and is causing much excitement in Black Hawk.

The Keith mill has commenced operations on Pewabic ore, which is said to be of unusually rich quality.

Mr. Miley has started the Holbrook eight-stamp water mill, on second quality ore from the Bobtail's Co's claim, on the Bobtail.

The Black Hawk G. M. Co. cleaned up and retorted, to-day, 359 ozs. of gold, as the result of one week's run from 80 stamps, on average ore from their Gregory mine.

The Troy lode, Nevada Dist., owned by Hinds & Ware, is now being successfully worked, and giving most satisfactory results. There is a "timbered" shaft 55 ft. deep on the discovery, out of which the owners are taking ore from a crevice from two to three ft. in width, that runs under stamps, \$151 per cord in gold. Also, a shaft on No. 1, 30 ft. deep, the quartz from which runs from \$80 to \$100 per cord, gold.

## IDAHO.

*World*, Aug. 28th: Col. Fogus and party this week discovered a gold bearing ledge somewhere between the head of Purdy Gulch and the New York mine. The ledge is 2½ ft. wide, and free gold is plainly visible all over and through the quartz on the surface.

Chas. Lihenau, metallurgist of Boise City, gives the following figures as the result of an assay of some picked ore from the Atlanta ledge, of Alturas county: Per ton, 9,720 ozs. silver and 2 40-100 gold, valued—in silver, per ton, \$12,636; gold, \$50.11, Total, \$12,680.11.

On last Saturday Mr. Harley brought a variety of specimen pieces of the ore, taken from various portions of the famous Atlanta ledge, to our office for exhibition. They were all rich, and some of the pieces showed actually more silver than rock or foreign substance. One piece is equal to the best specimens we saw at the celebrated Poorman mine of Owyhee last year, while the richest ores were being taken from it. This piece was taken from the first extension east of the Atlanta, at a depth of eight ft. from the surface croppings. From this portion of the ledge 55 lbs. of ore was recently taken, burnt and crushed in a hand mortar. The ore was picked from a rich central streak of 18 in. in width. The result was 4¼ lbs. of bullion! Ten tons of the average rock is now being crushed at Defries' mill to test the average yield.

Next to it is the second extension east, taken up by Mr. Motherhead, and in which very rich gold and silver quartz has been found all through the tunnel which pierces it. The ledge averages full 14 ft. width, and the rich streak extends all the way through it, of about 18 in. in mean thickness. The whole Atlanta ledge has been distinctly traced about a mile in length, and wherever prospected it has yielded from very good to exceedingly rich ore.

The fine new quartz mill recently bought in San Francisco, for the English Co., will be here about the middle of September, and will be put up early next spring.

New diggings have been found in a small basin about 125 miles from Boise City, which prospect from 12½ cts. to \$1 to the pan.

Owyhee *Avalanche*, Aug. 31st: The ore now being taken from the Whisky ledge is considerably richer than that which yielded \$300 per ton a couple of weeks ago.

In the Poorman mine, they have recently come upon a large quantity of pure, white, and soft wax-like substances, interspersed with large masses of black sulphurets. The Poorman yet sustains its world-wide reputation of fabulous richness.

The Oro Fino has just cleaned up, after crushing 80 tons of ore, amounting in the aggregate to \$13,300, or \$160 per ton.

Another rich ledge has been discovered

in Flint—right in town. It was located on the 24th.

**MONTANA.**

**Post, Aug. 24th.** The 15-stamp mill, known as the Seneca Falls mill, at Summit, belonging to McAndrew, Wann & Co., has been removed to Hot Springs creek. An addition of steam batteries, equal to fifteen stamps, is to be added to the above, and another mill of the capacity of 30-stamps, is on the way from New York. The Co. intend to concentrate all of their energies at that point. The mills will be up and in operation in 30 days.

The hydraulic claims of Messrs. Vivian & Co. were cleaned up on Thursday last, and the sum of \$5,500 taken out. The amount was from a run of eight days, and from the disadvantages under which the owners labored in starting their hydraulics, may be considered as a good test of the richness of the ground.

A gentleman who has just arrived from the Meadow creek country, informs us that a good mining region is being opened up on the head waters of Meadow creek. It is principally bar diggings, prospecting from 5 to 25 colors to the pan, and extending over a large surface of country. He estimates the hydraulic yield at \$10 to \$15 per day, and ground enough to employ 1,000 men. Water is plentiful, taken from North Meadow creek, and requiring to be conveyed from a half mile to one mile and a half. The country has been districted and Recorders elected. This may have something to do with a stampede if one is gotten up. About 25 men are employed there now, and 8 or 10 went over yesterday. A town has been laid out and christened "Bluff City."

**Aug. 31st.** Quite a stampede has happened lately towards Washington gulch, and the ground is staked off on all the gulches in the vicinity. From 12 to 20 cts. to the pan has been obtained, and about five feet to bed-rock. Isdell, who has a hydraulic working, has found the old channel some 15 feet below the bar where he is working, with as high as 25 cents to the pan, but will have to start in a new cut to reach it.

At Highland gulch, Graves & Co. have an arastra running near Red Mountain city, and are doing well, from the clean up Mr. Mansfield reports to us. They are crushing from the Last Chance lode, which has a three and one-half foot crevice. The dirt is hauled in a small wagon, drawn by one yoke of oxen. From six loads they cleaned up 56 ounces of retort, which sells at \$23 per ounce, and left 30 ounces still remaining in the arastra.

In speaking of Highland quartz and the prospects of Highland district, the editor says: It is less than a year since any leads were discovered in the district; in fact, the gulch had scarcely been prospected a year ago. Now we have specimens from thirty-one lodes, whose richness and width of crevice are not excelled in Montana. We have seen certificates of assay giving \$141 per ton on one of the larger lodes, and have no doubt that many of them are equally as rich. The larger proportion of the lodes are gold bearing, but specimens from some of those lately discovered and subjected to the action of fire, show rich in silver. We believe that Highland district is destined to become a great quartz mining camp at an early day, from the extent and richness of its leads, the excellent facilities and abundance of wood and water, the great requisites to successful mining.

**NEVADA.**

**Esmeralda.**  
**The Pine Grove correspondent of the Enterprise of Sept. 10th,** says: The Wheeler boys have struck a ledge of rich sulphuret quartz, which prospects \$40 free gold to the ton, and will, from appearances, yield five or six times that amount in silver. The Deposit Co. will soon have a return from a clean up of a run made by the arastras.

The Poorman and Imperial Cos. each, are in daily expectation of striking their ledges below water level. The Midas mine is looking fine. Lieut. Bourne is having 75 or 80 tons of ore worked.

The Wilson mine is being steadily worked. Mr. Toombs is taking out of it, under contract, some very fine looking white quartz rock, which is rich in gold, but the gold is covered over with a black substance which causes it to look like copper or iron until it is subjected to the action of friction or acids. The Central, which is a new discovery, southwest from Wilson's, is having some very fine rock taken out of it. The new mill recently purchased in San Francisco, is expected to arrive soon. It is a 10-stamp mill with a perfect amalgamating battery and the ordinary paraphernalia for saving the free gold only. Mr. Wilson intends saving his tailings and salting them as they accumulate. At the expiration of three or four months after their first working, he will then re-work them, with the expectation of

greater returns per ton than was first yielded and before the desulphurization.

**Humboldt.**

**Unionville Register, Sept. 7th:** The machinery for the Essex Co. is now on the ground at Dun Glen, and will be put up with all possible dispatch. A full set of hands are now on both the Essex and Empire mines, with the intention of having out a large quantity of ore as soon as the mill is ready to run.

**Pahranaगत.**

The Carson Appeal says that the mining prospects of the Pahranaगत Lake Mining Dist., never looked so fair as during this summer. The miners are all working in earnest, and as they go down upon their numerous ledges, find them well defined and immensely rich. There are three miles now ready for operation. Within the last year sales of mines have been made in that district to New York capitalists, amounting to over \$5,000,000.

**Reese River.**

**Reveille, Sept. 2d:** In Reveille and adjoining districts, business is more active than ever before. In Reveille Dist., the Rutland mill has been sold to Leason & Co., and is to be overhauled and put in shape for better work. Geo. Nichols, the assayer, has discovered a great ledge in the South Mountain, above the Desert Queen, which exhibits very rich ore to the depth of 12 ft., as far as it has been opened.

The owners of the Desert Queen, Idaho, Adriatic and Fisherman, are busily employed in taking out ore for the Old Dominion mill at Hot Creek, which will be completed and running about the 10th inst.

In the Morey Dist. the owner of good mining property is getting out 100 tons of first class ore for the mill at Hot Creek; and in the Danville Dist. the owner of the Vesta—a fine ledge of excellent mineral—is engaged in getting ore for the same purpose.

Persons just in from Belmont say that the 40-stamp mill of the Combination Co. bids fair to be a splendid structure. The Belmont Co. is about to overhaul its mill and put it in good working condition, with new cam shaft, improved pans and settlers, and the addition of a large new boiler. In the meantime, the mines of these companies are being well developed. The Combination is running a drift from the vertical shaft to the vein. The drift begins at the water level, and is now in close proximity to the ledge. As soon as the hoisting works shall be placed on the mine, the machinery for which is now in transit, the shaft will be continued. In the incline upon the Transylvania No. 1, belonging to the Belmont Co., a level extends north about 140 ft., in which the vein is much wider than near the surface, and carries ore of superior richness.

There were shipped from this city in the month of August by Wells, Fargo & Co., 11,265 lbs. of bullion valued at \$170,373.03.

Russell's stage from Cortez, on Saturday brought 19 bars of bullion, valued at about \$17,000, from the mill of the Mount Tenaho Co.

On Saturday three bars of bullion from the Belmont Co., were brought in by the stage.

**Sept. 3d:** Newark Dist. is quite lively, owing to the operations of the Centenary Co., which is hastening to complete its fine quartz mill.

White Pine Dist. is deserted by its ambitious miners, who have frantically rushed to Goose Creek.

**Sept. 5th:** The ore in the Twin Ophir mines in Park Cañon has greatly changed in quality, since the mine was opened. The ore formerly produced was a mass of metal, with almost no gangue, much resembling ordinary iron ore. But the mineral shown to us as coming from the mine is a very hard granular quartz of bluish-gray color, the surface of which contains points and flakes of native silver.

We saw at Lundholm's assay office yesterday a small bar of bullion, valued at \$595, which was produced by the first lot of ore worked in Coover's mill at Bunker Hill. The bar was very small; about seven inches long, two inches broad, and 1½ inches thick; but its value was derived from the large amount of gold that it contained, which was \$426 to \$169 of silver. This high bullion is the product of ore from the Victorine ledge, which will average upwards of \$60 per ton.

**Sept. 7th:** The other day a single blast threw out of the old Dominion mine in Hot Creek Dist., 3¼ tons of ore, the estimated value of which was from \$500 to \$700 per ton. We are assured that this estimate is low, for the ore exhibits the richest masses of soft, wax-like horn silver yet developed in the district.

Since the 24th of August 41,347 ozs. of crude bullion were received at the assay office of the Manhattan mill for melting and assay.

This morning the stage from the east brought 3,222 ozs. of crude bullion from the mill of the Social and Steptoe Co. at Egan.

**Alta, Sept. 10th:** The Parrott quartz mill at Big Creek, was entirely destroyed by fire on the 7th inst.

**Silver Bend Reporter, Sept. 7th:** The pulp assay of the first lot of Victorine ore crushed at Coover's mill, Bunker Hill, shows \$39.62 of gold and \$25.29 of silver per ton—a total of \$64.91.

The Murphy mine and mill of the Twin River Co. at Ophir Cañon, produced during the month of August the sum of \$34,015.90. And this at only one-half the capacity of the mill. There is a probability of the mill being closed shortly for the reason that a sufficient quantity of ore cannot be taken from the mine at the present stage of development to supply one-half the battery. The ore is plentiful in the mine, but the vein-stone is so extremely hard that it is tedious work to sink and run levels.

The mill of the Belmont Co. is now closed for repairs, but will soon be in operation in better trim than ever before.

**Washoe.**

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

**Enterprise, Sept. 6th:** The editor states that he has seen an assay of ore from the Lawson & McMeans mine, American Flat, made by Mr. Kern, of Virginia City, which was exceedingly encouraging to owners in that vicinity. A sample from the surface showed \$11.51 per ton, while another sample taken out eight ft. below the surface yielded at the rate of \$307.11. The company have a stream of about four inches of water on their ground and seem to be in a fair way to make something handsome out of their mine. The walls of the lead are said to be the same as those of the Comstock.

The Kentucky Co. has declared a dividend of \$25 per share on their capital stock, payable Saturday, the 7th of September, at the Bank of California in Virginia City and San Francisco.

Work has been resumed upon several old claims situated to the eastward of the Comstock range, in the direction of Silver Star Dist.

**Sept. 7th:** Wells, Fargo & Co. shipped during the last week from Virginia City and Gold Hill, 16,148 lbs. of bullion, valued at \$261,526.69.

**Sept. 8th:** Day before yesterday an eight-horse team, owned by Joe Reed, hauled from the Imperial dump, Gold Hill, to the Rock Point mill, Dayton, 38,850 lbs. of ore. The wagon and load weighed 48,350 lbs.

Work has been resumed upon the old Sutro mine on the north side of Cedar Hill, and excellent indications are being met with. A shaft has been sunk about 120 ft. from the mouth of the main tunnel, and at the depth of 55 ft. excellent ore obtained—assaying from \$25 to \$30 per ton.

**Trespass, Sept. 7th:** Recently an additional vein of water has cut in the McMeans & Clawson mine, at American Flat, and some ore from the ledge assays several hundred dollars per ton. The water seems to be permanent, and if so, will prove of great value to the owners.

The Crown Point shaft is now down 640 ft., and it will be completed 700 ft. by the first of October, if nothing should happen to keep the workmen back in the shape of a large vein of water.

**OREGON.**

The Eugene State Journal says that parties are still prosecuting their researches for quartz, in the mountains about the headwaters of the Willamette.

**Walla Walla Statesman, Aug. 23d:** In our issue of the 9th inst., we noticed the reported discovery of rich paying mines in the neighborhood of Pen d'Oreille Lake. In corroboration of this report we give place to an extract from a private letter, written by a gentleman who is on the ground, and whose statements may be considered entirely reliable. He says: "We are in the midst of an excitement caused by new gold discoveries in this vicinity. If these mines are half as good as represented, they will be the making of this place. Men in whom I have the utmost confidence tell me that they have prospected about seven miles of the creek, and got from 25 to 50 cts. to the pan. A prospecting party has just started out, and in a few more days I shall be able to inform you sure as to details."

The late 20-inch gun manufactured at the Fort Pitt Works at Pittsburgh, Penn., was tested by Commander Lowe of the United States Navy, August 5th. The test, so far as made, was entirely satisfactory.

**Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!**

**REASONS WHY.**

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

**Opinions of the Press and others in regard to Bussey's Combination Lock.**

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

**BANK OF BRITISH COLUMBIA,**  
San Francisco, May 24, 1866.  
Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval. They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We use the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable. As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

We do hereby certify that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied special to Vanita and Safes, to entire satisfaction to parties interested.

**W. H. TILLINGHAST,** Sub-Manager.  
Placer Iron Works, cor. Fremont and Market sts.  
SAN FRANCISCO, May 6, 1867.

I do hereby certify that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safe and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

**JOHN R. SIMES,**  
Vault Manufacturer, Oregon street.  
JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

- 1st.—Because it is impossible for either burglar or export to pick it.
- 2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.
- 3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

**R. GOSNER,**  
Attested by J. C. SHEPMAN, County Clerk.  
JACKSON, April 27, 1867.  
The undersigned, Treasurer of Amador County, do hereby certify that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

**OTTO WALTHER,**  
Attested by J. C. SHEPMAN, County Clerk.  
**CALIFORNIA LOCK AHEAD.**—A special premium was awarded Mr. W. C. Bussey for his Superior Combination Powder and Burglar Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been sustained. It can be used for its full purpose. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at a very reasonable rate.—**(Mining and Scientific Press, Sept. 29, 1866.)**

They are the only SAFE LOCK ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—[San Francisco Union.]

We, the undersigned, practical Locksmiths, unanimously pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

**F. MARKT & C. FLAISEL,**  
No. 18 Post street.

**REFERENCES:**  
R. GOSNER, Sheriff.  
O. WALTHER, Treasurer.  
W. JENNINGS.  
C. H. INGALLS, } Supervisors.  
L. McLANE, }

Any good blacksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 20 in Pacific Coast Directory.]  
A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1865.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. T. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. W. D. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

San Francisco:

Saturday Morning, Sept. 14, 1867.

## Notices to Correspondents.

ITALIANO.—The Amazonian artist, named Ornata Rudiano, your countrywoman, whose memory you wish to be specially noticed amongst the number of remarkable artistic females which have at sundry times graced this sublunary sphere, certainly merits a few lines being devoted to the enumeration of some of the remarkable incidents connected with her most romantic life. Ornata, in her 23d year, had obtained so great a reputation for skill as a painter that Gahrino Fondolo, the tyrant of Cremona, proffered her the commission of adorning his palace. Ornata was desirous of declining the dangerous honor, but the Marquis would not admit of any excuse. At this period to excite the anger of such a vindictive and unscrupulous a personage would have been dangerous. One day, whilst engaged in painting the walls of one of the apartments in Fondolo's palace, one of his most dissipated courtiers entered the room and attempted to take some unjustifiable liberties, which were indignantly repulsed by this truly heroic lady. In place of retiring, the scoundrel made a second and more violent attempt, on which Ornata drew a dagger which she always had concealed beneath her hodie, in anticipation that such an emergency might at any time occur. She plunged it to its hilt into the villain's heart; then rushing from the palace, disguised herself in male attire and fled to the mountains, declaring that she would rather perish in exile and a wanderer, in purity, than enjoy splendor with tainted honor. The Marquis was furious, sent soldiers in every direction in pursuit, with orders to bring her back alive or dead. She fortunately avoided all the dangers which beset her. On finding further pursuit useless, owing to her escape from his dominions, and not being able to obtain any one capable of completing her labors, he proclaimed a full pardon, on condition that she would return. In the meantime, retaining her disguise, Ornata became admitted as a member of one of the companies of Condottieri which then infested Italy, in which capacity, by her courage and good conduct, she soon rose to the post of Captain. The independence and excitement accompanying this position, appears to have possessed considerable charms, as it tended to draw out a congenial and innate warlike spirit, as she subsequently refrained from entirely abandoning her new career and continued for thirty years thereafter fighting and painting alternately. In 1472, her native town, Castelligne, was besieged by the Venetians, on hearing which she flew to its relief, and forced the enemy to raise the siege, but was mortally wounded in the conflict, and died a few days later.

FOUNDRYMAN.—The capacity of the human frame to withstand elevated temperatures, is much greater than is generally supposed, and by physiologists is very generally attributed to the cooling influence of perspiration; the evaporation in ordinary life is calculated to amount to from two to five pounds every 24 hours. Dr. Southwood Smith, however, ascertained that workmen in gas works employed in making up fires and similar occupations, subjecting them to great heat, lost on an average, 3 lbs. 6 ozs. in 45 minutes, and when working for 70 minutes in an unusually hot place, their loss was 5 lbs. 2 ozs. and 4 lbs. 14 ozs. respectively.

[Editorial Correspondence.]

## Fourteenth Annual State Fair.

The Fourteenth Annual State Fair is proving, as we predicted it would, the most successful of the series, both pecuniarily and as a representative exhibit of the various industries of the State. Its active and energetic Secretary, Mr. Hong, together with other officers and members of the Association, and the cooperative committee, appointed by the Mechanics' Institute of San Francisco, have been unceasing in their efforts to bring about this result; and it must be as gratifying to them as to the public to witness the result of their endeavors.

At a meeting of the Board of Directors, held on Wednesday evening, it was unanimously resolved to continue the exhibition over until Wednesday of next week. This action alone is sufficient evidence of its great success. Indeed, it is universally conceded that the State Agricultural Society has this year, at least, achieved a most gratifying success.

San Francisco is largely and well represented in almost every department. The success of the present effort will doubtless operate largely in securing for the future a progressive improvement in these annual exhibitions, and one which shall be more fully in keeping with the progress of our various industries, than has heretofore been generally witnessed. Too much importance cannot be attached to these practical exhibitions of the advancement of the material interests of the State. However much visitors may have been heretofore interested in and astonished at these developments, we feel well assured that the present exhibit cannot fail to impart to all careful observers, new and much enlarged ideas of the productive wealth of California, and operate as a most powerful incentive to redouble the exertions of all actively engaged in industrial pursuits.

It would be impossible in the brief space which we can allot to the present letter, to give anything like even a "brief mention" of the various exhibitions which have been made. We can only allude to a few of the more prominent ones, and reserve for the future more particular reference to them and others.

## THE ATTENDANCE,

Upon this exhibition has been unusually large. Every boat from San Francisco up to the present writing, has come crowded with visitors; the same has been the case with every train by the railroad; while the country round about in the immediate vicinity, has poured forth its population through every medium of travel attainable. The city is crowded to excess with strangers, and great numbers of visitors are obtaining their meals at restaurants and hotels, while lodgings are furnished at various private dwellings, whose occupants have come freely forward to accommodate the rushing throng.

The streets present a most cheerful and lively appearance, being constantly thronged with pedestrians and vehicles of every description. The rushing and jostling on the sidewalks quite reminds one of Montgomery street in its liveliest times.

## THE PAVILION,

Is constantly thronged with visitors. In the evening it is most inconveniently crowded, so much so that locomotion is almost out of the question, and hundreds are constantly coming and going. Very little, if any, room has been allowed except to meritorious exhibitions. The usual display of fruit is very considerably curtailed in extent, mainly, we presume, for want of room; but ample amends are made in excellence and variety. The wine exhibit is hardly up to what was expected, or what should be made by so large and growing an interest. The upper floor is mainly devoted to manufactured goods, the fine arts, and miscellaneous exhibitions. The display of woollens is most particularly striking and suggestive, especially that portion which embraces "knit goods," and exhibited by the Pacific Woolen

Mills. The works of this company are fully described in other parts of our present issue. It can scarcely be credited by the thousands of visitors at the Pavilion, that such an extensive and intricate branch of manufacture could have grown up in our midst within less than one year, and almost unheralded. Yet such is the fact, and the evidence is spread out before the visitors at the Fair in a manner which is as unmistakable as it is astonishing to all beholders. They exhibit fully one hundred different varieties of manufacture, to which we shall more particularly refer at a future time. The Mission and Pioneer Woolen Mills have also most gratifying and extensive exhibitions. No visitor can pass them by without being strongly impressed by the great importance and value to our industrial interests. The Pioneer Company has a fine loom at work on the lower floor. The aggregate value of the productions of these will reach to nearly or quite two millions of dollars the coming year!

## THE SILK EXHIBIT,

Also on the upper floor, is one of the chief attractions of the exhibition. Through Messrs. Prevost and the managers of the Silk Factory at San José, the public are favored with a continuous exhibit of this business from the cocoon to the manufactured dress goods. There is a reel at work on the upper floor, showing the manner in which the silk is taken from the cocoon, and by its side is a loom in which is seen the progress of weaving a piece of dress goods. The advance in this branch of industry is still progressive, and as promising as ever of early and most important results.

## THE MACHINERY DEPARTMENT,

Is much fuller than it has ever been before at our State exhibitions. It attracts much interest. A long line of shafting has been put up the whole length of the Pavilion, in a shed which has been constructed upon the outside and along its whole length. One of the chief attractions in this department is a Hicks Engine, exhibited by the Miners' Foundry, which we propose hereafter to fully describe. Mr. Hallidie also exhibits one of his wire-rope making machines; Mr. Hanshrow exhibits his planetary or waltzing pan. Various other machinery of different kinds is exhibited, which we cannot to-day notice even by name, but shall do so in future.

## THE RACES,

Of course, attract, as usual, a large amount of the attention of a certain class; but as we never have yet been able to see how they specially benefit the industrial interests of the State, we have not found time to visit or notice them.

AN OREGON COLLEGE OF MEDICINE AND SURGERY.—We have received the Annual Announcement of the Medical and Surgical Department of the Willamette University, at Salem, Oregon, in the shape of a neatly printed circular, and are pleased to learn that the department is in a flourishing condition. The Faculty is composed of eight professional and practical resident physicians of that place, and a Professor of Medical Jurisprudence. The object of uniting this department with a regular College, is to allow students to prosecute their studies in both branches at the same time. We are pleased to receive these notices of educational progress, as every step in the right direction more fully does away with the necessity of sending our young men away from their homes in order to acquire a professional education. From the circular we find that three graduates have been sent out to heal the sick, and that there are now twenty students in attendance. We are personally acquainted with the dean of the faculty, Prof. H. Carpenter, a gentleman of unusual medical acquirements, and under whose care the institution is sure to establish for itself a wide reputation.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

## Progress of Our Industrial Interests.

## OUR WOOLEN MANUFACTURES.

Chief among the important manufacturing interests which are growing up in our midst, may be mentioned that of woolen. It is only about seven years since the first attempt was made to establish a woolen factory in California. The business was inaugurated amidst predictions of failure on all sides; but the enterprise and energy of the parties engaged in the experiment succeeded in overcoming all obstacles, and we have now three establishments in this city, each as complete in its line as any similar mills in the Union, besides several others projected or in progress of erection in the interior, to say nothing of Oregon. The quality of the goods turned out at the California mills has also constantly improved, while the business of the several establishments has been as regularly increased. It is a matter of history that the blankets and clothing furnished the California troops during the war excited the admiration and unqualified praise of the authorities at Washington, and all others who took the pains to examine, and possessed the requisite knowledge to judge of such matters. Subsequently, large contracts for the Spanish and Russian navies gave equal satisfaction as that of our own Government. Taking into consideration the past prosperity of this branch of our State's industry, its future promises a still more profitable result, as increased facilities and experience come to our aid. We are already able to supply all our own wants in those classes of goods, the manufacture of which has been undertaken here; and the time is not far distant when we shall be able to meet the entire wants of the Pacific coast, and even compete, by our superior position and facilities, for the markets of Eastern Asia and the islands of the Pacific.

## THE PACIFIC WOOLEN MILLS—CALIFORNIA KNIT GOODS.

Although our people are familiar with the fact of woolen mills in our midst, comparatively few, we opine, are aware that we have in successful operation in this city an establishment devoted especially to the manufacture of knit goods—all wool and cotton and wool. This new enterprise presents a most interesting feature in the history of the industrial progress of the State. We took occasion, a few days since, to visit this factory, where we spent some two hours or more in examining the latest, most improved and most interesting class of machinery connected with the modern production of woolen goods.

The Pacific Woolen Mills, designed for the exclusive manufacture of knit goods, were started in April last, but have only recently got fully under way. This establishment is owned by a joint-stock company, with a capital of \$400,000—about \$200,000 of which has already been paid in, and expended in land, buildings, machinery and stock. The main building is a substantial brick structure, 112x60 feet, and 3½ stories high. The machinery is of the latest and most approved kind, combining the best features of both English and American invention.

## THE MANAGEMENT.

The mill has been erected under the immediate supervision of Mr. James Roberts, one of the proprietors and chief manager. The superintendent of the mill, and the one who has the general charge of the detail of the work, is Mr. Thomas Appleton, Jr., a gentleman who has had fifteen years experience in this especial branch of woolen manufacture in the Eastern States. The agent for the mill is George F. Bragg; agents for the sale of the goods, Lazard Frères, Battery street. Through the kindness of Mr. Roberts, we were shown over every part of the works, tracing up the various stages of progress, from the washing of the wool to the final finishing touches of the manufactured goods.

## THE MACHINERY.

On the lower floor are the various machines for picking, washing, drying and finishing. The machine for washing wool

is a recently invented and great labor-saving machine, applicable to wool, but not to clothing. There is on this floor a centrifugal drying machine, for removing the water from the manufactured goods, which runs at a speed of 1,200 revolutions a minute, and forces the moisture from about sixty pounds of goods in about five minutes' time, so that a few minutes subsequent exposure to the sun or a drying room readily removes the remaining dampness. There are two picking machines, one of which is more particularly designed for removing the clover hurr and filagree seed, and other such like foreign substances from the wool. Mr. Roberts informs us that the removal of the clover hurr and filagree seed is a very difficult and expensive work; and that any considerable quantity of either of these substances depreciates the value of wool nearly one-third—or from twenty or twenty-one cents (the value of the raw wool) to twelve and a half cents per pound. Wool growers will do well to make a note of this, and use every exertion to keep their fleeces as free as possible from such depreciating entanglements.

The second floor is the carding room. The wool first passes through what is called a "scribbler," which is a kind of carding machine that prepares the wool for the "breakers." This scribbler is an English machine. The solidity and massiveness of its every part fully indicates its nationality. The wool next passes through a first and second breaker and a finisher, which last delivers it in the form of a large loose slightly-twisted rope yarn, ready for the spinners. There are five sets of this last machinery, which is of American make. There are also in this room two sets of self-cleaning cotton carding machines—an American invention, of some ten years standing. These machines are among the novelties of cotton machinery, and are but recently introduced into Europe. Their presence in this establishment is one among the many indications of a determination to be behind no other similar manufactory in the way of improvements.

THE SELF-OPERATING MULE.

We next go into the third story, where, first of all, is seen that great novelty in human mechanism, the self-operating mule. As we stood watching the stately marchings back and forth of the long rows of spindles, and observed the growing bulk of yarn neatly and uniformly wound upon each, with all the complex machinery, moving obedient to the will, but yet unaided by the hand of man, we could scarcely refrain from the thought that the whole must be instinct with life and reason. Our imagination involuntarily wandered back to the dark and dingy garret where the genius of Arkwright first wrought out from his prolific brain the dim outlines of a machine, which, by gradual and progressive improvement, has finally culminated in this apparently *ne plus ultra* in spinning machinery. What would be the feelings of that great pioneer inventor could he but revisit this earth for an hour and witness the perfection to which his early invention has been carried? Even to the eye of one accustomed to the intricacies of modern invention, the heterogeneous mass of clock-work, levers, springs, pulleys, weights, etc., by which the complicated movements of this wonderful machine are produced, seem almost a miracle of human ingenuity. There are four of these machines at this mill, each about eighty feet long, and capable, by the attention of one man to each, of doing the work of 800 persons by the primitive mode in which it was done before the immortal Arkwright introduced his first spinning machine. This machine is susceptible of ten different changes, by the substitution of different sets of gearing, by which as many modifications may be effected in the fineness, hardness, greater or less twist, etc., of the yarn which it produces.

THE KNITTING MACHINERY.

Passing to the further end of the room we were, if possible, still more interested in the wonderful performances and varied movements of the knitting machines. Of these machines there are nine in a row, known as the "Shaker Ribbed Stocking Machine," all tended by one boy, and capable of knitting the legs of one dozen stockings each hour. These machines are quite new, the latest invention in this line, and are just beginning to be introduced even at the East.

The legs of great number of stockings are knit in one long piece of hose, and afterwards cut into proper lengths for single stockings, and the heels and toes added by a subsequent process, in another machine. There are seven of these machines. There are next twelve machines for making both plain and ribbed stockings for ladies, each

of which may be run separately, or all together. One boy, upon six of these machines, can make twenty-six dozen pairs in one day.

There are next four other machines, of a different description, designed for knitting patent elastic ribbed shirts and drawers, capable of making twelve dozen each day with one attendant for the four.

Then we have six machines similar to the one which is illustrated and described on our first page, designed for plain shirts and drawers, each of which turns off 100 shirts or drawers per day.

MORE MACHINERY EXPECTED.

The proprietors will receive a lot of new machinery in about six weeks, which has been ordered for the especial purpose of manufacturing a finer class of goods than any which have yet been produced. It is the determination of the proprietors to fully answer the demands of this market for every possible quantity of goods of this description. The machinery now expected will supply the finer qualities, such as are now imported from England, and the manufacture of which has not yet been attempted, even in the Atlantic States.

CAPACITY OF THE MILL, ETC.

This mill is now capable of turning out 100 dozen stockings and 62 dozen shirts and drawers daily. It uses up about 24,000 pounds of wool and 4,000 pounds of cotton monthly, and turns out about \$25,000 worth of goods in the same time. The goods are all of a very superior quality, heavy, strong, remarkably well finished, and quite superior and more desirable than the same classes of goods brought from the East. They are furnished to the trade at prices always as low, and in some instances lower than inferior goods from the Atlantic States.

Upwards of 100 hands are now employed at the mill, about half of whom are Chinese; 30 white women and 20 white men are also employed. The Chinese are mostly employed in tending machinery, and take the place of boys and girls. They live together and by themselves in a house belonging to the mill company. They are said to be very quiet, teachable and effective. They can attend a machine as long as everything works smooth, but when anything goes wrong John don't *sabe*, and must look to the white man. All the skilled work is done by white men, and nobody about the establishment has any fears that John will ever aspire, or reach, if he does aspire, to any proficiency as a skilled laborer.

A large item in the labor employment at this establishment is the work done outside by females, who take their work home. This work is the fine seaming of the goods, joining the edges together, etc. Such work cannot be done by machinery. About 200 females are employed in this business, mostly those having families, and who have a few hours to spare each day. This is a kind of employment greatly needed in this city, and as furnishing it, this establishment is doing a most important and philanthropic work.

THE PEOPLES' COAL MINING COMPANY.—We have received the prospectus of this company, organized for the purpose of working the coal veins near Corral Hollow, in Alameda county. Considerable work has already been done upon the mine. A shaft has been sunk to the depth of 310 feet, and a steam engine with hoisting and pumping apparatus erected. To increase its facilities for extracting and delivering coal, the company now solicit a subscription of \$100,000. They offer full paid stock at one-half its par value, convertible at the option of the holder into coal certificates, payable in the company's coal at market rates. They state that with this aid they will be in a position, by the 1st of May next, to raise and deliver 300 tons of coal per day, with a constantly increasing yield.

The officers of this company are: H. J. Booth, President; A. Casselli, Vice President; Camilo Martin, Treasurer; A. Noel, Secretary. The office of the Treasurer is at the London and San Francisco Bank.

READING FOR SUNDAY.—Most people in this State depend upon the weekly papers for their Sunday reading. Some prefer *solid* matter; while others forget care and hard work in the perusal of emotional and sensational literature. To the first we say, read the PRESS; to the last, take the Golden Era—the oldest weekly paper in the State—a paper which offers you 48 columns every week of light and entertaining matter, both original and selected. See the advertisement of the same in another column.

NORTH AMERICA Life Insurance Company.

Usual Restrictions on Occupation and Travel ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World! J. A. EATON & CO., Managers Pacific Branch, 302 Montgomery st. 20v14m3d SAN FRANCISCO.

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v151f

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. SEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with *PERM COBALT*—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 61 Commercial street, opposite United States Branch Mint. 15v14-3m

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler—repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where rights can be procured, or all needed information, on application, in person or by letter, to 5v14-1v AUSTIN A. WELLS, Agent.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Normalizing and Improving Influence, exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

BROOKS & CAPP, San Francisco.

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars and further particulars, address Du. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15-6m

SACRAMENTO SEMINARY.

Boarding School for Young Ladies, 1st street, between Tenth and Eleventh streets, Sacramento. The present Session commenced July 29th, and will close December 29th. A full course of instruction is given. Six Teachers are employed. For further particulars, address HEDDON PERRY, Sacramento, Cal. 11v15-1m

Builders' Insurance Company—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street. FIRE AND MARINE INSURANCE. 10v1419pqr

BUSINESS NOTICE.—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

FOR CABINET PHOTOGRAPHS, or Enneamed Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v15qr B. F. HOWLAND, Artist.

Perry Davis' Vegetable Pain Killer.

We sell the following from the Providence (Mass.) General Advertiser: "At this season of the year, when cholera, cholera morbus, dysentery, and other kindred complaints are sure to prevail, everybody should be liberally supplied with Perry Davis' Vegetable Pain Killer. Persons leaving home, whether it be for a day's excursion or a trip to Europe, should be in a condition to place their hands upon that a moment's warning. Many diseases incident to the summer months, which will prove fatal if not immediately checked, can be promptly cured by one or two doses of the Pain Killer. On more than one occasion have we been relieved of intense suffering by the timely use of the above named preparation. Sold by all Druggists, Grocers and Medicine Dealers everywhere. 10v15-1m

ROOT'S Patent Force Blast Blower.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 per cent less power than any Blower now in use. For further particulars, address KEEF, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 6v15110p

Oakland College School.

THE PATRONS of this institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California. The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art. The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided. Throughout all the various departments, great attention is given to the study of the Modern Languages. For further information, or Catalogues, address, I. H. BRAYTON, Principal. OAKLAND, California. 5v15qr5p.

LINSEED OIL.

The Pacific Linseed Oil & Lead Works

Are now prepared to furnish dealers and consumers Pure Linseed Oil, Raw or Billed, at the Lowest Market Rates. We call especial attention to the quality of our Oil, believing it to be superior to any Imported Oil offered in this market. Also, Oil Cake Meal, the best article known for fattening stock and increasing the production of milk. Cash paid for Easton Seans and Linseed, on delivery at the factory. Address, Pacific Linseed Oil and Lead Works, Care of L. B. BENCHLEY & CO., 19v14-3m5p San Francisco.

AGENTS WANTED

ENERGETIC MEN OR WOMEN CAN MAKE MONEY by canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v15qr5p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Works, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. F. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Plate, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for punns.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veateli's tubs, Printer's concentrators, Waklee's pans, Heers' pan, German Barrels, Arastra Clearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or Iron frames, Dry Crushing Batteries, or maelincs with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screws, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH, GEO. W. PRESCOTT, IRVING M. SCOTT  
2412 H. J. BOOTH & CO.

TIME TO LIVE.—One great affliction of Americans in this generation is that God did not put more than sixty seconds in a minute; and that, in our haste to get a living we have not time to live. We have not time to eat, to sleep, to wash, to read Shakspeare, to play with our children, to get passably acquainted with our wives, or articulate our mother tongue. If we could but add to the national time as easily as we can to the national domain, if we could but have nine days in the week, or thirty-six hours in the day, would we not—what? Attend to some of these little neglected matters? Bah! As the German proverb saith, "Who believes it goes to heaven?" No. We should make a little more money, run a little more rapidly into consumption, build a few more mad houses for the public convenience, and settle down a few years sooner into the tranquil retirement of a softened brain.—*Theo. Tilton.*

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

**LARGE MASSES OF NATIVE SILVER.**—The Swedish papers state that in the Kongsberg silver mine a lump of silver has recently been found weighing 400 pounds. The mines of Kongsberg, in Norway, have previously afforded numerous magnificent specimens of native silver. One specimen from these mines, now in the royal collection at Copenhagen, weighs upwards of 500 pounds. Two masses were obtained, some twelve or fifteen years ago, which weighed severally 238 and 436 pounds. A specimen of native silver was once taken from the Batopilas mines, Mexico, which weighed 400 pounds. The largest specimen ever found, however, was from the mines of Huantaya, in Southern Peru. This most magnificent of all specimens of native silver weighed *eighteen hundred pounds!*

**AGRICULTURAL COLLEGE.**—Five buildings are now in process of erection, to be occupied by the Massachusetts Agricultural College. Their aggregate cost will be about \$75,000. The number of applicants for admission is greatly exceeding all expectation. Four or five of the different county agricultural societies have endowed scholarships. Gen. William P. Sutton, President of the Essex Agricultural Society, has also endowed one from his private purse.

**Mineral Land Law Blanks FOR SALE.**

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declinatory Statement.
- II. Diagram, Description of Diagram and Boundaries, and Notice.
- III. Register's Order for Publication—with Notice.
- IV. Deposition that Notice has been Posted.
- V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

**FIRST**  
**Paint Manufactory**  
IN CALIFORNIA.

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufac-  
ture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**

It is for all exposed surfaces; impervious to wet; will not  
rot, peel, blister or crack, in any climate. A superior Paint  
for brick, wood, cloth, metals, etc.; successfully used in the  
Eastern States. The old tin roof of that large building, the  
New York Rice Mills, was in such bad condition it was about  
to be taken off ten years since. Instead, they put on the  
**INDIA RUBBER CEMENT AND PAINT,** making a good  
tight roof. A coat of India Rubber Paint every two years  
since keeps it in good condition. We can refer to many  
others. The Atlantic Lead Works use our Paint only.

**NEW CLOTH ROOFS** put on; copings and all seams  
cemented and saturated, then coated with the India Rub-  
ber Cement and Paint—the same as on the St. Nicholas  
Hotel at New York City, the City Buildings and many  
others, the roofs of all the horse and steam cars, decks of  
steamboats, etc., around New York—for eight dollars per  
one hundred square feet. **NEW OR OLD TIN ROOFS**  
cemented and painted with the India Rubber Cement and  
Paint guaranteed, at from one cent to two and a half  
cents per square foot, according to size and condition of  
roof. Good work and the best materials used.

We have just cemented and painted old tin roofs of Dr.  
H. D. Goswell, Pills & Co., D. J. Oliver, etc., and the  
wood work of Sheriff Davis' building, 33 feet front, on Fol-  
som street, between Third and Fourth streets—only one  
coat. The work will speak for itself. Now painting the  
cornice and iron work of Dr. H. D. Goswell's building,  
corner of Front and Clark streets—one coat. See the above  
and further references at our office.

**ELLERY'S PATENT INDIA RUBBER CEMENT AND**  
**PAINT** is composed of India rubber and other gums, dis-  
solved in linseed oil, mixed with the various coloring mat-  
ters, and ground in any color. When applied to roofs or  
other purposes, it is mixed with pure linseed oil to the re-  
quired thickness, and put on as other paints are, with a  
paint brush—retaining sufficient elasticity to give and take  
with the heat and cold. Fifteen hundred fishing vessels at  
Cape Ann use the India Rubber Paint, finding it superior to  
all others.

**EPES & E. H. R. ELLERY** are now prepared to make  
good roofs and cement and paint new or old ones, and do  
all kinds of outside painting with Ellery's Patent India  
Rubber Paint. An asphaltum or coal tar used.  
Office, No. 226 Jackson street, corner Battery, San Fran-  
cisco, Cal. 6v15

Pacific Chemical Works. NITRATE OF SILVER.

Messrs. FALKENAU & HANKS—Gents:—I have subjected the sample taken from your Nitrate of Silver to a thorough analysis, and find it to be chemically pure, not containing the slightest trace of any impurities whatever. Respectfully yours, THOS. PRICE. Messrs. FALKENAU & HANKS—Gents:—I have examined the sample of Nitrate of Silver of your manufacture. I have never seen in this market, Nitrate of Silver, manufactured here or imported, so free of every kind of foreign matter, and find it not only adapted to Photography, but it was subjected to every mode of examination, aside from critical chemical analysis, and every test applied confirmed the opinion that a purer article could scarcely be produced or desired for medicinal purposes. DR. L. LAUSZWE EKT. Nitrate of Silver manufactured by FALKENAU & HANKS, Pacific Chemical Works, San Francisco. For sale by all Wholesale Druggists and Importers of Photographic Stock. 4v15altw

MOSHEIMER'S PIONEER MINING SCHOOL -AND- Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1. Assaying of ores, metals and other mineral substances.
2. Technology, or Chemistry, as applied to any special branch of manufacturing.
3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc.
4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.
5. Concentration. Dressing of ores.
6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology.
Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore learn first, if you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful.

It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufactories carried on on my own account, have not only given me lessons, but more than ordinary ability.

I was the first one in California who successfully extracted silver by smelting, on a large scale, and have since been traveling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process.

I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works. My lately invented Roasting Furnace has the following advantages: A Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurets. The total expense of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas or quicksilver when amalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Naitman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores.....\$3 00 Copper ores..... 5 00

Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY, San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The Machine can be

Seen in Operation At Booth & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR.

For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$50. The box will answer of wood.

By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address

ANDREW HUNTER, Union Foundry, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast.

BY

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077 3v13f SAN FRANCISCO.

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 23 Second St., and 108 and 110 Jessie St. 2v15qy San Francisco.

Invulnerable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1.—Or 12 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600

No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... 850 No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, E, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1865.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your best sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. F. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers. Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in California, and Nevada. Stockholders and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 23, 1865. BRODIE & DOBLE, Express Building, 402 Montgomery street, San Francisco. 12v15tf

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA: KEPPNER & STODDART, Colson, O. Simmons, Oakland, (Mill at Clear Lake); MORZAN COVINGE, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular to

LEFFEL, KNAPP & GRANT, Agents for California, 26v15-lyq 310 Washington street, San Francisco

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine, With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine, Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO., Pacific Iron Works, San Francisco, Aug. 29, 1867. 9v15tf

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

WESTGATE'S PATENT NON-CONDUCTING SAD IRON AND SAD IRON HEATER

Is the best and cheapest Ironing Apparatus ever invented. It will save fifty per cent of Fuel. No family should be without one. For sale by LOCKE & MONTAGUE, 10v15-2t 112 and 114 Battery st., San Francisco.

NELSON & DOBLE, AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, (San Francisco. 10v14q

PATTINSON'S HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use. Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. THOMAS PATTINSON, 7v15-qy

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a quartz mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address, F. M. SHAW, San Francisco, care Mining and Scientific Press. 26v143m

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-ly Stove Store, No. 125 Clay street, below Davis.

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK. On the 10th, 18th and 30th of each month that has 30 days. On the 10th, 16th and 30th of each month that has 31 days. When the 10th, 16th and 30th fall on Sunday, they will leave on Saturday preceding, when the 18th falls on Sunday, they will leave on Monday following. Steamers leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco. Departures of 14th or 18th connect with French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America. Departure of 14th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America. The following Steamships will be dispatched on dates as given below: September 10th—GOLDEN WELLS.....Capt. W. F. Lapidge, Connecting with UENRY CHAUNCEY, Capt. Gray September 18th—CONSTITUTION.....Capt. Parker, Connecting with the RISING STAR, Capt. Conner. September 30th—GOLDEN AGE.....Capt. J. M. Cavarly, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attend ance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock. Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of \$20 to \$25 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO. 23—The Steamship CHINA, Capt. E. W. Smith, will be dispatched October 14th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets. OLIVER ELDRIDGE, Agent.

MECHANICAL PROGRESS IN ENGLAND.—The London Quarterly Journal of Science, takes Dr. Playfair severely to task for asserting that English manufacture is retrograding, and that her mechanical and civil engineers are lamenting the want of progress in their industries, while other nations are making wonderful advances. The Review asserts that "the English iron furnaces are improving in construction and increasing in size. The iron from inferior ores is greatly improving in quality. Her mills are the finest in the world, and capable of executing any work for which there may be a demand. They are the only people in the world who are striving—and striving, too, with any prospect of success—to carry out the process of puddling by machinery; and where else is coal cutting by machinery in so far advanced a state as in the British coal fields? In the processes of smelting, great advances are being made—and from ores of lead containing copper, the best lead can now be manufactured. Indeed in each of our metallurgical processes, we can point to improvements which will show how exceedingly imperfect is the knowledge possessed by Dr. Playfair; and a little consideration would have prevented Earl Granville from basing his remarks—made at the distribution of prizes at the London University—on so fallacious a letter as that addressed to Lord Taunton."

THE IRON SAND OF New Zealand, according to the London Quarterly Journal of Science, is again attracting attention in England, and a new company has been formed to work it. The Journal expresses the hope that the next experiment of making pig iron from this ore may be practically more successful than the former attempts to do the same thing. We are of course to infer from the above, that the experiments to which we referred in the PRESS, a little over one year ago, were a failure. This "iron sand," it should be borne in mind, is the same mineral as the "titanic iron sand," found on the beach near the Ocean House, to the west of this city. Parties interested in the experiments to utilize that sand, will doubtless be pleased to learn that there is yet a prospect of devising some method for rendering the remarkable qualities of that mineral of practical value in the production of superior iron.

GOLD MINING IN ENGLAND.—The gold mines of Wales, which a few years since were of considerable promise, have recently become almost entirely unremunerative. But two of these mines produced any gold in 1866—the Vigra & Clagon, and the Castell Carn Dochan. Both of these mines yielded an aggregate of only 1,200 ounces of gold.

GROWTH OF THE WEST.—The progress of the west is described by a writer in the Cincinnati Gazette, who says that seventy-three years ago the first boat started from Cincinnati up the Ohio. It was bullet-proof, equipped with two cannon and small arms. The round trip to Pittsburg was made in about four weeks. At that time Cincinnati was a mere military post, which, three years afterwards, only contained 500 inhabitants. Pittsburg was a little nest, built away up in the forks of this great highway of nature, and between these two points a wilderness stretched on either side of the river. Seventy-three years since, and Fort Washington, with a population of two or three hundred, is Cincinnati, with a population of 250,000; Pittsburg is no longer a nest, but it is a great city; the two or three dots of civilization between those two points have multiplied into 110 thriving cities and villages, all palpitating with the industry of a free and generous people. The steamers that now ply the river, could they all be brought together, would make a floating city in which a hundred thousand people could dwell in comfort.

WORK on the Virginia and Truckee Railroad, says the Virginia Tresspass, has been commenced. The engineers began, September 2d, the work of leveling, and soon the contractors will be offered the data on which to base their proposals for contracts.

WASTE.—As many as 50,000 tons of soap, used in silk manufacture, were formerly allowed to pass off to waste in the Rhone.

A NEW SPRING.—A large stream of cold, pure water, says the Arizona Gazette, has lately burst forth from the rocks about 300 yards north of the Dos Palmas station.

TWO MEN SUFFOCATED IN A MINE.—A dispatch, dated Grass Valley, Sept. 8th, says: A sad accident occurred last night in the Iouic mine, about two miles from this city.

THE advance in the price of petroleum has set the wells in the Pennsylvania oil regions flowing again, and the production is perceptibly on the increase.

Our Patent Agency.

THE PATENT AGENCY of the MINING and SCIENTIFIC PRESS has been signalized with remarkable success during the past two years.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

THE SEVENTEENTH ANNUAL SESSION of this College will commence on August 23, 1887.

TERMS.—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$35.

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

5v15-lin REV. A. MASNATA, S. J., President.

The Commercial Herald

MARKET REVIEW

Will be issued early on

EVERY STEAMER-DAY MORNING.

(TRI-MONTHLY).

Office—Southwest corner Washington and Battery streets, Opposite Post Office and Custom House.

THE HERALD will contain full and reliable commercial details, and elaborate articles on the monetary affairs of the Pacific Coast.

The Letter Sheet Market Review, containing selections from the COMMERCIAL HERALD, printed on tissue paper, for transmission abroad, will be published simultaneously with that paper.

Weekly Stock Circular.

Merchants can have their cards prominently inserted in the Letter Sheet MARKET REVIEW.

THE CENTRAL PARK OF THE PACIFIC.

Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, AND ZOOLOGICAL GARDENS.

A GRAND INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays a GRAND CONCERT OF SAURED MUSIC, appropriate to the occasion.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.

Entrances on Mission and Valencia streets, between Thirteenth and Fourteenth. OPEN EVERY DAY. Admission to all parts, 25 Cents. Children, under 12 years, half price.

Stair Work of all Kinds, MADE TO ORDER, And Shipped to all parts of the Coast.

Oliver, Morton Cheesman, A. Hansmann, D. W. U. Elice.

LACOUR'S SARSAPARIPHERE BITTERS

Have so speedily grown in favor that their unrivalled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the baseness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry.

LACOUR'S SARSAPARIPHERE BITTERS.

They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by cutaneous excretions, and other substances which gently stimulate the secretions of the lower glands and organs, render digestion easy, obviate constiveness, and remove regularly every impurity of the blood.

Who Takes Them?

- The Old Man: Takes them as a gentle stimulant and mild rejuvenator. The Young Man: Takes them to regulate his system, prevent disease, and stimulate to new life his overworked body. The Young Woman: Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health, to give a sparkle to her eyes, and sweetness to her breath. The Husband: Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family. The Wife: Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness.

- Children: Take them as a gentle, yet effective tonic. The Dashaway: Takes them as a mild, pure stimulant, containing none of the deleterious, essential and useless oils of ferri-bolide drinks. The Inebriate: Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does not madden or destroy. The Traveler: Takes them to prevent sea sickness, and secure his health against change of climate. Everybody Takes Them! PRO BONO PUBLICO! 2v15-6m

Assayer and Chemist. A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office. 5v16r

Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

We have received a box containing several fine specimens, among which are the following:

175—Nevada Co's large lead, Grass Valley, consisting of a mass of sulphurets of iron, about fifteen per cent. of quartz and five per cent. or upwards of galena, said to be paying well under the superintendence of W. M. Radcliff.

176—The Wigham ledge, Nevada county, owned by Merritt & Co., San Francisco, specimens of quartz-bearing gold, interspersed with bi-sulphuret of iron.

177—Lucky mine, Grass Valley, Bamber & Co. proprietors. A very rich specimen of gold-bearing quartz, gold in the utmost purity being interspersed throughout the rock in a moss-like and feathered condition. This rich lead is said to be twenty inches wide.

178—Eureka mine, Grass Valley, Watt Brothers part owners and exclusive managers. Specimens, consisting of quartz and pyrites, both intermixed with spots of gold. At the junction of the more quartzose portion with the pyritous vein, gold is visible in the same manner as that described in the last named specimen. The same box which contained the above, also had others, the description of which has not been forwarded to us, but which we hope to be able to describe next week, as well as some from Arizona.

JACOB SNOW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street.) takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new 'Cabinet Photographs,' which he is taking to perfection. 10v14t

MINING COMPANIES

Can get their Printing done cheaper and better by TRUESDELL, DEWEY & CO., Than at any printing establishment in the city.

COUNTY OFFICERS

Can get their Blank Books and Blanks cheaper of TRUESDELL, DEWEY & CO., Than of any other printing house in the city.

HENDY'S LATEST IMPROVED CONCENTRATORS,

FOR GOLD AND SILVER ORES,  
With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

- FIRST—Set the Pan, A, level, by its inner rim.
- SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
- THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

The above directions, if followed implicitly, are all-sufficient. But, strange as it may appear, the proprietor has found that, in certain cases, they have, owing to the carelessness or to the ignorance of the operators, failed to serve as a complete guide. He, therefore, in the present edition of his circular, insists upon their being followed to the letter; and in order that there may be no mistake in future, he thus elaborates and explains them:

First, then: Unless the pan is level, it is out of the question to expect it to do its duty. One would imagine that the slightest possible examination of the illustrations would be sufficient to show this. Yet, in one case, where the machine did not work satisfactorily, it was found that no regard whatever had been paid to this point! The word level is in itself precise; it admits of no latitude, and cannot be misunderstood. Nothing is easier, to a mechanic, than to place the pan absolutely and mathematically level. It cannot be necessary to dwell further upon this point.

Direction Second, viz:—"Keep the pan about half full of sulphurets," has also, in some cases, been disregarded. A moment's reflection will point out its importance. The operation of the machine is such, that grains of any kind, whatever may be their size or weight, will seek the periphery of the pan, and unless discharged, will there remain, until other grains of greater specific gravity take their place. Of course, then, at the starting of the machine, and for a short time thereafter, the periphery will be partially filled with sand. It is therefore necessary to allow a quantity of sulphurets sufficient to completely occupy that space to accumulate, before the gate is opened, and their discharge commenced. It is obvious that they will otherwise be accompanied with more or less of sand. Once properly commenced, the discharge will be continuous. It must be regulated, however, by the richness, in sulphurets, of the pulp under treatment. A little practice will enable the operator to gauge it without difficulty.

After what has been said, direction Third requires no further explanation. Direction Fourth is, to a mechanic, sufficiently explicit.

These concentrators can be set in pairs, for which a single crank shaft will suffice. Two such pairs can be so arranged as to require a driving shaft of only six feet in length.

The guaranteed capacity of each machine is five tons every 24 hours. Eight tons, however, can be and has been put through in that time. The small proportion of sand which the sulphurets carry, when thus rapidly concentrated, is not an objection but rather an advantage, in case the operators themselves intend to work them. Either in roasting or in pan-working, a small admixture of sand is unquestionably an aid. But if the sulphurets are being prepared for sale, they must of course be clean. In this case, the discharges from four machines can be conducted into a single additional one, and the concentration thus be made complete.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

- FOREST SPRINGS MILL.....Grass Valley, Nevada County.
- EMPIRE MILL.....Grass Valley, Nevada County.
- INDEPENDENCE MILL.....Brownsville, El Dorado County.
- HUMBOLDT CANAL CO.....Humboldt County, Nevada.
- EL TASTE CO.....Sonora, Mexico.
- BENTON MILL.....Bear Valley, Mariposa County.
- LOUISIANA MILL.....Coulterville, Mariposa County.
- PEOPLE'S MILL.....Allegany, Sierra County.
- TYRON & CO'S MILL.....Prescott, Arizona.
- WOOLSEY & CO'S MILL.....Prescott, Arizona.
- NOYES & CO'S MILL.....Prescott, Arizona.
- GUADALUPE & SACRAMENTO G. & S. M. CO.....Sinaloa, Mexico.

RECENTLY ORDERED FROM THE UNION IRON WORKS:

- VEATCH, VALENTINE & CO., Commercial Mill (4 Concentrators).....Nevada County.
- GOULD & CURRY G. & S. M. CO. (4 Concentrators).....Virginia City, Nevada.
- VULTURE CO. (4 Concentrators).....Prescott, Arizona.
- MIDAS MILL CO. (4 Concentrators).....Virginia, Montana.
- PLYMOUTH ROCK MILL CO. (2 Concentrators).....Mariposa County.
- B. F. BROWN (1 Concentrator).....Melbourne, Australia.
- MOREY & SPERRY (1 Concentrator).....New York.

And in use in many other parts of this coast.

These Machines are made of iron, thoroughly constructed and ready for immediate use. For description, etc., send for Circular.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit.

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:  
"J. HENDY, Patented February 27th and April 17th, 1866."

Foundry for Sale.

A One-half Interest in the  
UNION IRON WORKS,  
SACRAMENTO,  
Owned by William R. Williams, is offered for sale on the  
most favorable terms.

A Good Bargain

May be had, as the proprietor is going home to Europe. It  
is seldom that so good an opportunity is offered for a sure  
and permanent investment. The business of the establish-  
ment is exceedingly flourishing, as can be shown. The  
Shop is of brick, new and well built. The lot is 85 feet front  
by 163 feet in depth. In a good location for this business, on  
Front street, between N and O streets.  
Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS,  
Sacramento, Cal.  
25v13f19-16p

Greatest Invention of the Age.

BOWMAN'S  
AMERICAN WASHING COMPOUND  
And housewife's true friend, saves one-half the labor,  
one-half the time, and one-half the expense.  
For WASHING CLOTHES, CLEANING HOUSES, RE-  
MOVING PAINT, GREASE, etc., it is unequalled.  
It makes hard water as soft as rain water.  
For sale at \$1.50 per can of five gallons, at the manufac-  
tory, 222 Jackson street, near Battery. Please send your  
orders, by mail or express, to LYNCH & PARSONS,  
25v14-2m6t San Francisco, Cal.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new  
laws relating to mining and corporations in Cali-  
fornia and Nevada, passed in 1865-6. Some of  
these laws are of the highest importance to parties  
interested in the matter of locating and holding  
claims, and prospecting mines, in these States.  
Copies sent by mail. Price, 25 cents.  
Address, DEWEY & CO., Patent Agents,

**OCCLUSION OF HYDROGEN GAS BY METEORIC IRON.**—Thos. Graham, F. R. S., read before the Royal Society on May 16th, a paper on the above subject, detailing some interesting experiments in the investigation of the history of metals by means of the gases which have been absorbed by them when last in a state of ignition. The Lenarto meteorite was selected as the subject for examination, being pure and soft, and therefore well adapted for the purpose. It was found to have retained within it, imprisoned or occluded, hydrogen from the fixed stars, far beyond the brief space of a few thousand millions of miles to which our solar system extends. A piece of this meteorite 50 millimeters long, 13 wide and 10 thick, was cut from the mass, cleansed and placed in a porcelain tube connected with a Sprengel aspirator. The tube was then heated in an ordinary combustion furnace by ignited charcoal. Gas was freely evolved, which in 2½ hours amounted to 16.53 cubic centimeters. This gas burned like hydrogen, and when analyzed gave 85.68 hydrogen, 4.46 carbonic oxide, 9.86 nitrogen in the 100. As the volume of the iron was 5.78 c.c., it appears to yield 2.85 times its volume of gas, of which 86 per cent. is hydrogen. Now, since hydrogen has been shown by spectrum analysis to be present in the fixed stars, and by Secchi to be a principal element in some of them, we may fairly suppose that the Lenarto meteorite has brought to us the hydrogen of those distant bodies. Moreover it is found that malleable iron can scarcely be made to occlude more than its own volume of hydrogen under the ordinary atmospheric pressure. But the meteorite gave three times this quantity. Hence Graham infers that it must have originated in a dense atmosphere of hydrogen gas, beyond the limits of the light cometary matter of our solar system.

**A NEW AND USEFUL PREPARATION.**—We would call the attention of laundrymen, clothes-cleaners, milkmen and others requiring an article for facilitating their operations in washing and cleansing, to the advertisement of Messrs. Lynch & Parsons. This compound, introduced here by this firm and to be found at the groceries throughout the city, is becoming a favorite among the different classes using it, in consequence of its cheapness and efficiency.

**CENTRAL PARK,** always a pleasant and quiet retreat from the noise and dust of the business portion of the city, continues to attract crowds of visitors, particularly on Saturdays and Sundays, when music is made part of the entertainment. Since our last visit to the Gardens, Mr. Woodward has added a very large polar bear to his zoölogical collection. It is said to have been taken at sea, many miles from the coast.

## Wood's Gas Governor.

It requires no argument with any person at all conversant with the consumption of gas to prove the value of a simple, cheap and reliable apparatus, or "governor," to secure an automatic regulation of the pressure of service pipe, and keep it constantly at the proper standard to give a good, cheap and economical light at the burner. This regulation is usually effected by frequently

who turn on their gas early in the evening, or those who continue their lights after the bulk of the burners throughout the city has been turned off.

By reference to the illustration, the gas is supposed to enter the right hand pipe, E, at the top, and is conveyed to the receiver, C, passing out of the pipe just below—the discharge being regulated by the elevation or depression of the cone-shaped valve, h, through the opening in the top of the

the valve, h, which closes upon its seat and shuts off the gas just in proportion to the pressure; thus keeping the pressure uniform in the receiver, C, and consequently in the service pipes, F.

A personal inspection of the working of this governor enables us to say that there is no doubt about its ability to regulate the pressure in the service pipe to the proper standard, giving thereby a steady, bright and economical light, strongly contrasted with the usually variable light obtained directly from the constantly varying street pressure. The saving made by its use is claimed to be from twenty to forty per cent. of the amount of gas consumed in the ordinary way.

Its simplicity of construction overcomes all objections in regard to complications, making it at once patent to every observer, that it can be regulated and managed by the merest child, avoiding even a possibility of getting out of order. Its cheapness brings it at once within the reach of all classes, thereby benefitting the small as well as the large consumer.

Messrs. Bush & Stokes, who have bought the patent right of this useful instrument, may be seen at 706 Montgomery street, where they will be happy to exhibit the same to all gas consumers. They have there fitted up a series of burners by which they are able to explain and illustrate to the comprehension of the dullest intellect, the difference between burning gas taken direct from the supply pipes, and after it has passed through one of their governors. The effect of this gas governor is more perceptible than that of the mechanical contrivance usually attached to a steam engine, which is expected to do constantly varying work.

**ANOTHER ICE MACHINE.**—Monsieur Carré has invented a new machine for making ice, based upon the experiments of Dr. Leslie. He says it costs only sixty francs, and has been worked by him eighteen months, without requiring repairs. The acid used is dilute, of 52° Beaumé. The receivers are made of an alloy of lead and antimony, which will resist the action of sulphuric acid, he thinks, for twenty years. A crust of sulphate of lead is formed upon the surface at its first attack, which effectually prevents farther corrosion. The copper air-pump is preserved from contact with acid by an arrangement which constantly bathes its inner surface with oil. The apparatus maintains a vacuum for several months, and produces two or three parts—by weight—of ice, to one part of acid of 66° Beaumé; no ice being obtained until it is diluted to 52°, by the vapor of water flowing in a tube in which a small stream of the acid is allowed to circulate. Potash and caustic soda are also used instead of the acid, although the latter is the most economical.

**MUSIC.**—"When shall I see my darling again," is the title of a song by Stephen Masset, which has just been published by J. T. Bowers & Co., 133 Montgomery street. It is printed in good style by Truesdell, Dewey & Co., 505 Clay street.

WOOD'S PATENT GAS GOVERNOR.

turning on or off the gas as the street pressure varies. The trouble and lack of efficiency connected with that is obvious. When a portion only of the lights in a city are turned on, the pressure is excessive, and a large amount of gas escapes from the burner in the form of smoke, visible or invisible, and is wasted, while the light from the balance is much less than it would be if a less amount of gas was passing to the burner. This is especially noticed by those

short leg of the right hand pipe, E. After passing into the receiver, C, it passes thence, under a uniform pressure, through the left hand pipe, F, to the burners. The action of the governor is in this wise: There is a closed chamber in the bottom of the receiver, C, which buoys up or balances the weight of the receiver when immersed to the proper point of adjustment. Any increase of pressure in the supply pipe, E, causes the receiver to rise, together with

[Editorial Correspondence]

## Fourteenth Annual State Fair.

Space will not admit of a full report, even on the more prominent exhibitions at the State Fair. We append a partial report, and shall continue the same next week. Our present issue is confined chiefly to the agricultural and mechanical parts of the Exhibition. In our next, we shall allude to the leading manufacturing interests, and miscellaneous matters, including silk, hops, wines, etc.

## CLASSIFICATION.

The entire exhibition was divided into seven classes, as follows: 1st class, Live Stock; 2d, Machinery, Implements, etc.; 3d, Mechanical and Domestic Products; 4th, Agricultural Products; 5th, Horticultural Products; 6th, Fine Arts, etc. We will endeavor to give a brief review of the exhibition, taking up each class separately, and in its order.

## 1ST CLASS, LIVE STOCK.

The display at the stock grounds was quite full, and attracted much attention. The first parade of stock took place on Monday, at the stock grounds. The procession was headed by a line of seven thoroughbreds, followed by graded horses, each in charge of a groom; roadsters to wagons followed, and draft horses, jacks and jennies came in turn, the line being closed up with Durham, Ayrshire and Devonshire horned stock. A large number of ewes, of the most improved breeds, were exhibited. J. H. Laundrum of Stanislaus, exhibited four Cashmere goats.

Mr. Laundrum has 400 head of goats of full, three-fourths and seven-eighths blood. The fleece of either of the two latter is said to be nearly equal to the full thorough bred. The fleece from a thorough bred, such as is employed in the manufacture of Cashmere shawls, is worth from \$6 to \$8 per pound in France. The heaviest fleece ever taken from either of those on exhibition at the present fair, weighed about four pounds.

The races attracted a large and miscellaneous crowd at the Park. The carriages and buggies in and about the enclosure, numbered at times not less than 300; and over 1,500 visitors are estimated to have been present at one time. The daily programme generally included three races. The total number of visitors at the Park could not have been less than 5,000. We may take some future occasion to speak in full of the management and morality of exhibitions of this description.

## 2D CLASS—MACHINERY, IMPLEMENTS, ETC

The chief portion of the machinery was located on the lower floor of the Pavilion, and under the temporary shed on its south side. Great efforts have been made by the society, in this department; and through the especial exertions of Mr. Thomas Hansbrow, actively aided by the committee of the Mechanics' Institute, a really fine exhibition was made—one much in advance of any of the previous displays of the State Society. The exhibition department was made under the immediate supervision of Mr. Hansbrow, who devoted his entire time and efforts to the same. We regret our inability, from want of space, to do full justice to this part of the exhibition. We can allude only to its most prominent and novel features.

**The Corliss Engine.**—Goss & Lambard, of Sacramento, exhibited one of the celebrated Corliss engines, of about 50-horse power, which was the chief motive power employed at the Pavilion. This is really a beautiful piece of mechanism, and by its nicety of adjustment of regulator, cut-off, etc., a saving of fully thirty per cent. in fuel is claimed for it over most other engines. The cut-off adjustment takes place twice with every revolution of the crank. Several ends of great importance are claimed to be secured in this engine, chief among which may be mentioned the rapid and wide opening of the valves in the cut-off and their almost instantaneous closing. By this means the greatest possible amount of power is derived from the least quantity of steam. The automatic action of this engine has probably reached a greater degree of perfection than is found in any other in use. While this is a great advantage in localities where fuel is scarce and labor and mechanical skill is cheap, it must be proportionally inconvenient and less economical where fuel is cheap and labor high. Such an engine should never be trusted to any but a skilled mechanic and engineer. Its employment in cities and populous places, with dear fuel and cheap skilled labor, will probably be found more economical than in interior or isolated localities, where the reverse is true of fuel and labor. In the latter case, we should be inclined to recommend rather

the Hicks engine, which, being exceedingly simple in construction, needs less skill and care to keep it in order, and which we will, in this connection, briefly introduce to the reader.

**The Hicks Engine.**—One of the most attractive features in this department, is the four cylinder Hicks engine, manufactured at the Miners' Foundry in San Francisco. It was almost constantly surrounded by visitors anxious to understand the mechanism of this novel motive power, so totally unlike any other engine ever seen. Its performance gave most universal satisfaction, and fully proved its great utility if not decided superiority over steam engines of other construction. The limits of this review will not admit of a full description of it at this time; but we shall endeavor to give such a description at an early day. For the present, we can only describe it as an engine without either valves, valve-rods, eccentrics, rock-shafts, packing-boxes, slides, cross-heads, or even piston rods. It is constructed with four cylinders, set in pairs, with a crank shaft running between them. By curiously constructed ports and passages, and a novel connection of the pistons with the crank shaft, the steam is admitted directly into two of the cylinders, first acting upon their own pistons, and next with a new supply, transmitted through them, into the other two. Each piston having performed its share in urging forward the revolution of the crank, immediately becomes itself, a slide-valve, to govern the inlet and outlet of steam to its neighbor—at the same time each piston acts as a cut-off to its own cylinder, stopping the supply at half stroke, and accomplishing the balance of the stroke by expansion, aided by a full head of steam in another piston. By this latter arrangement every half stroke is produced by a conjoint action of full and expansive steam. The economy of such an arrangement must be manifest to every engineer. This engine is a recent American invention, and is now for the first time introduced upon the Pacific coast. The claims for it are: Great economy in space and weight; a great reduction in friction; extreme simplicity in construction; superior durability and saving in repairs; more rapid valve motions; impossibility of getting cylinder out of line, or of stopping on its center. In fact, it has no center—no more than a rotary engine has—while it can be almost instantaneously stopped and reversed.

The Committee on Awards reported that it was difficult to determine as between these two engines, both claiming a premium, unless they could see tests made by the indicator, with exact data as to fuel consumed and work performed. The tests could not be had. Hence the committee made their awards simply upon an examination of the principles of construction, and the appearance and action of the two engines, while in the performance of work. The first premium was awarded to the Hicks engine for simplicity of construction, economy in space, facility of transportation, and little experience required to operate it; and recommended it for use in mining, hoisting, saw-mills and other places, where simplicity of design and small liability to get out of order are considered advantages.

To the Corliss engine was also awarded a first premium, for economy in the use of fuel, and for the ease and certainty with which its motions can be regulated, and recommended it for mining and flouring mills, and heavy work.

**Amalgamating Machine.**—Senatz & Knowlton exhibited their patented amalgamator, a full description of which we gave a year ago. The committee called especial attention to this concentrator for concentrating ores, and recommended it as having the appearance of being effective and economical.

**Washing and Wringing Machines.**—Several of these useful labor-saving machines were on exhibition, and in operation more or less of the time, doing daily washings, much to the edification of both male and female lookers-on. F. B. Lamb, who exhibited the Pioneer Washing Machine, from San Francisco, appeared to be tireless in his efforts to show up the superiority of his machine. He claims to have sold 3,000 of his machines on this coast. A. B. Parsons, of Sacramento, exhibited a machine of quite a novel construction, and which approached the nearest to hand work of any machine we ever met with. The ladies seemed much pleased with it, if we are to judge by the number of fair hands which tried it. Mr. Lamb also exhibited Williams' cog-wheel wringer, for which a two dollar premium was awarded. Honorable mention was made of his Pioneer Washing Machine.

**Tube Wells and Pumps.**—Most of our readers have heard of the method lately devised of obtaining wells by merely driving a tube into the ground, and placing a pump into it. The apparatus by which this is

effected, together with the tubing employed, is exhibited by Mr. S. P. Roberts. When the tubes are driven into the earth, they are preceded by an iron "plug," with a point, like that in a stake, the first section of the tube being perforated with a great number of holes, to let the water through the side thereof. Section after section is added to the tube, as it is forced down, precisely as is done in tubing artesian wells, only that in the case of these wells the tubing is made thicker and stronger, to admit of the necessary pressure being applied to force it down. After the pipe is driven to the necessary depth, it is withdrawn a few inches, by which operation the plug is separated from the tube, and the holes in the side of the first section of the tube left free for the ingress of water—the flow of which is greatly increased by the vacuum created by the action of the pump. The pump employed is somewhat novel in construction, and peculiarly adapted to this description of wells. The valve, which is a common iron ball valve, is placed below the water line, and is so constructed that it is hardly possible for it to get out of order. This pump and well is particularly applicable to sandy and other loose soils, easily penetrable, although it can also be readily and economically employed when it is found necessary to drill, as in artesian wells. The cost of sinking a well in the sandy or clay soils in and about San Francisco, is about 50 cents per foot, for 50 feet or more, including the pump. It only requires from thirty minutes to two hours to sink a well in any of the loose soils about San Francisco, Oakland, etc. One of these pumps was in operation in the yard of the pavilion, and attracted much attention. The committee recommended this well and pump for honorable mention.

**Hooker's Pumps.**—Mr. Wm. D. Hooker, already well known as the inventor of the Excelsior pumps, exhibits quite a novelty in this line. It is the model of a direct acting steam pump. In this new invention, which is now for the first time, placed before the public, the slide valve used in all other steam pumps, being entirely dispensed with, as well as all other outside attachments. These usual appendages to a pump are substituted by a single plain cylinder, which is perfectly balanced, and operated by the exhaust steam from the main cylinder. By this arrangement, the pump can be driven to an unlimited velocity without danger of injury to any of its parts. This little model attracted much attention from mechanics and others conversant with such machinery, and was unanimously pronounced a most ingenious and valuable invention. We shall soon illustrate, and more particularly describe it. Mr. Hooker also exhibits one of his Excelsior pumps, with a glass covering on one side which exhibited the somewhat peculiar working of the valves of that pump, of which seventeen different patterns are made. A first premium was awarded the above described direct-acting pump, for fire engines and other purposes, and it was recommended for simplicity and rapidity of motion.

Mr. Hansbrow, of Sacramento, had on exhibition several styles of his celebrated challenge pumps. This pump is too widely known to need any description at this time. Mr. H. also exhibited his patent planetary, triturating and amalgamating pan, which was in motion during the entire time of the exhibition. It appeared to attract considerable attention from persons engaged in quartz mining. This pan is highly spoken of by those who have used it. It was awarded the first premium.

**Of Stoddard's Pumps** there were two on exhibition—a 3-inch and a 4-inch; the latter having a capacity of lifting a column of water 240 feet high. These pumps are simple in construction, effective, durable, and economical. He also exhibited several of Gifford's injectors. Huntington & Hopkins, of Sacramento, entered the Holly elliptical rotary pump and engine, a well known Eastern invention.

**Hoyes' Patent Steam Pump** was also exhibited—a 4-inch pump which it is claimed is capable of ejecting 100 gallons a minute, and throwing a stream 200 feet from an inch nozzle. This pump has two discharges and two suction. Hineckly & Co., San Francisco, were the exhibitors. Mr. H. also exhibited the model of a novel and valuable fire escape ladder, for which an application for a patent is now pending. The same gentleman exhibits his patent fire hose clamp, a most useful invention for the temporary closing of leaks or bursts in fire hose, when in action. A first premium was awarded for his hose clamp; also for his fire escape ladder.

**The American Steam Siphon Pump** was exhibited by David Strickland, of the Steam Navigation works, through Mr. Garratt as agent. We have fully described the action

of this pump in past issues. This pump recently had a pretty severe trial in pumping out a grain loaded and water logged barge, on the Sacramento river. Both water and grain was discharged in six hours. The barge was 180 feet long, 32 feet wide, by four feet depth of hold.

**Wilcox's Water Lifter** occupied quite a prominent place in the machinery department. This lifter is worked directly by steam without the intervention of an engine. It uses both expansive and exhaust steam; is without piston, plunger or buckets. It will raise sand or grain as well as water; and will raise to any height within the pressure limit of the steam boiler which may be used. It is cheap, durable and simple in construction, but difficult of description without an illustration. We shall probably soon be able to give an illustrated description of it, when our readers will be able to form their own conclusion with regard to the principle and efficiency of this new device for raising water. Especially economy is claimed for this pump in raising large quantities of water. A first premium was awarded to it as the best apparatus for irrigating purposes.

**Woodward's Mechanical Novelties.**—F. Woodward exhibited models of a number of mechanical novelties, among which was an improved gauge for centering round iron; a dredging machine, for removing sand-bars in rivers; an improved snow-plow and shovel; an improved car wheel, so arranged as to greatly avoid the friction incurred in passing around curves; an improved locomotive driving wheel; and an oil-box and car axle. His novelties excited considerable interest, and he was indefatigable in explaining them to visitors. The Committee on Awards in the machinery department stated that they desired to call especial attention to these various inventions and improvements, as exhibiting originality of thought, and many of them as being worthy of practical experiment.

**Cross' Patent Boiler Feeder and Heater** were pronounced by the Committee on Awards as the best, most practical and most effective for heating and purifying water for steam boilers. A first premium was awarded for this feeder and heater, as the most practical and effective invention for the object designed.

**Church Bells.**—Wm. T. Garratt was awarded the first premium for church bells. His exhibition was of his own manufacture, and his bells were pronounced superior in tone and workmanship.

**Saws.**—The Pacific Saw Manufactory made a fine exhibit of mill saws of various kinds, for which they were awarded a first premium. Their exhibit was highly recommended by the Committee for its superior temper and finish.

**Wire Work.**—Mr. Graves, of San Francisco, made a most extensive and meritorious exhibition of wire work. He was unanimously pronounced the most extensive and complete wire-worker on the Pacific coast. He was accordingly awarded a special premium and diploma. His exhibition, in connection with the

**Wire Rope Exhibition** of Messrs. Hallidie & Co., attracted much attention, especially the wire-rope machine, with which this process of manufacture was practically displayed. This machine attracted much attention, and was quite a feature of the Exhibition. A first premium was awarded to it, and it was specially recommended by the Committee as an ingenious and highly useful machine for the carrying out a most important branch of industry on this coast.

**Lead and Pipe.**—After "wire-working" "pipe-laying" is generally considered as presenting the next most important branch of industry in this direction. The Pacific Lead Pipe and Shot Works, of San Francisco, T. H. Selby & Co., made a fine display of lead works, demonstrating for the first time, by public exhibition, that California can furnish everything she needs in the line of lead manufacture, from her own mines and through her own manufacturing works. Though quiet and modest, this was one of the most really valuable exhibitions made at the Fair. Lead pipe was exhibited of all sizes, from one-fourth of an inch to six inches in diameter, of a quality equal, if not superior, to any heretofore brought forward from any part of the world; also sheet lead, bar lead, drop and buck shot, mine balls, pistol balls, etc. In erecting these works the company appear to have had in view the future as well as the present wants of the coast, as they have not been sparing of expense to perfect their establishment. The Committee on Awards called special attention to the above, retaining as it does a large amount of money in our State, encouraging and aiding in the developing of our lead mines, and giving an impetus to home industry. The articles exhibited were pronounced by the Committee superior to any

they had ever seen imported, and would receive high commendation at any exhibition in the world. The Committee recommend not only a diploma, but such other testimonials as the Board of the Society might see fit to confer.

**Powder.**—The Santa Cruz and the Marin mills both made a very fine and full exhibition of California made powder. The Committee on Awards for this section stated in their report that both companies presented powder of various grades and very excellent quality. The agents of the Marin mills, Howard & Coleman, display a great variety, viz: eight degrees of blasting powder and seven of sporting powder. The agents of the Santa Cruz mills, Adams, McNeill & Co., exhibited seven grades of blasting powder and four of sporting powder. It was thought that the qualities were so nearly equal that it would be unsafe and unjust to give a credit of superiority to either; and the Committee, in view of the great importance to the State, reported that full and elaborate tests should be had before a decision could be made as to the superior quality of either. Both were commended as home manufactures of great importance, and a special premium for each was recommended.

**Eureka Hair.**—Among the new articles of California production—and, indeed, an entirely new contribution to the world's necessities—was the "Eureka Hair," as it is called, a manufactured vegetable product from the hitherto worthless California soap-root, and intended as a substitute for curled hair and pulu. It is furnished at about half the price of the former, and is considered nearly or quite as good. There were few articles on exhibition that exceeded in prospective importance this novel exhibition. It is an entirely new article of production, and may ere long enter into the consumption of almost every civilized household in the world. The extent of this industry is almost unlimited, and as utilizing a thing heretofore considered a nuisance, it would seem to be worthy of special attention. This material was brought from Dutch Flat by the Eureka Hair Company, who hold a patent right for its manufacture. We clip the following notice of it from the *State Fair Gazette*: "Who would have thought that the 'tarnal peskey soap-root' of California, that has caused so much trouble and violation of the principal commandment among our farmers, would ever be turned to any good use? It is true that the Diggers, from a time whereof the memory of Mahalax runneth not to the contrary, have used it for cleansing purposes, whenever they were tired of being classed as the 'great unwashed,' but that it should ever be brought into service as a luxury, discounting any other article heretofore used for comfort and cheapness, never before entered the noddle of any sane man. Yet here we have it, dur, shredded and curled, all ready to be placed into the most luxurious couch or easy chair which the upholsterer's skill can produce. There is one thing about this article that we must make mention of, and that is, it contains no animal matter, and is never troubled with moths or vermin." This interesting and really meritorious exhibit appears to have entirely escaped the awards of the Committee to whom it should have been referred—at least, we do not see any mention made of it in the published list. This must have been an unintentional oversight, for its value is beyond question. It has been thoroughly tested for mattresses and upholstering purposes. The Union Square Baptist Church, in this city, is entirely upholstered with it, cushions and backs, and is pronounced one of the neatest and best executed pieces of church upholstering in California. Quite an extensive factory for its preparation has been put up at Dutch Flat, and additional works have been established in this city for its further preparation, coloring, etc. It already affords employment for quite a number of people, which employment is rapidly increasing. We noticed a large number of bales of the root as collected, lying by the side of the C. P. Railroad, during the excursion to Cisco, evidently awaiting transportation to the factory.

#### AGRICULTURAL MACHINERY.

In the agricultural section of this department there was a very fine display of machinery of almost every description employed for farm use. This display was one of the most interesting and important in the Fair. Agriculture, always of promising importance in every community, is fast becoming one of special interest to this State, as a source of revenue from abroad. The sudden increase of our flour export from a mere nominal amount to *ten millions* annually, seems to have infused new life into our agricultural population, and the present indication is that almost every branch of that industry available for exports, will soon furnish its quota to swell our rapidly increas-

ing shipments. To accomplish this we must have machinery. Our broad fields and ample and fertile valleys, afford a most extraordinary field for the employment of capital in this direction, and our inventors are already at work, devising new mechanical appliances, and modifying those already in use to suit our particular needs. The display at the State and District Fairs this year, show that we are not behindhand in such matters.

Such has been the progress in this direction within the last few years, that machinery for planting and harvesting has almost entirely changed the character of that labor. Eight and ten times more work is now done on a farm, by the aid of machinery than could be done twenty years ago, while the price of produce has been vastly decreased and the value of farms proportionally increased by the same medium. We have already recently illustrated several important California inventions in farm machinery and have several more to follow.

The Messrs. Treadwell, of San Francisco, contributed to the Fair a most wonderful evidence of progress in the line of agricultural machinery, in the form of threshers, reapers, mowers, fan mills, drills, churns, etc., for which quite a number of premiums were awarded.

Baker & Hamilton exhibited a six by twelve inch portable steam engine, with one of Pitt's improved threshers; also reapers, mowers, horse rakes, cider press and mill, a burr stone farm mill for grinding corn or wheat, a corn sheller, cultivators, etc. One of their mowers was subjected to a trial at the Park, with Treadwell's "Kirby mower." A large number of premiums were awarded for their exhibition.

**Jackson's Grain Lifter.**—Mr. Wm. M. Jackson exhibited a grain lifter, which is certainly a most useful machine for the farm. The object of this invention is to enable the farmer to save his grain which has lodged or been broken down, so as to lay below the reach of the "header." It runs ahead of the cutting teeth, carefully picking up the fallen or trampled corn, and carrying it direct to the "header," thus saving from one to two sacks on almost every acre of ground—often more. It is extremely simple and cheap, costing but \$50, and adapts itself, with very little human help, to all sorts of grain, tangled or untangled. Those who have used the machine—and the number of such is large—say that it saves from forty to fifty dollars' worth of grain per day. We shall illustrate and more fully describe this machine in a future number. A diploma was awarded to this useful agricultural implement, several hundred of which are already at work in this State.

**Fruit-Drying House.**—The usual process of drying fruit in the open air is so uncertain and difficult, and so objectionable for want of cleanliness, that there is a universal demand for some different method. Various devices have been resorted to; but we have seen nothing which seems better calculated to accomplish the object than Billings' Patent Drying House, exhibited in model. It is so constructed that there is no danger of scorching the fruit, or of communicating fire to the house. A long cylinder of sheet iron is constructed, running entirely through, with a returning flue on each side. By this means a steady heat can be obtained at small expense of fuel; and being made on the principle of the air-tight stove, it will require but little attention. By the admission of a proper draft into the drying house, a constant change of air is secured, and a constant and rapid removal of moisture, so that the properties of the fruit are fully preserved, and no fermentation or decomposition can take place. It is an Eastern invention, has been largely introduced into the Western States, and should be employed by every fruit-grower in California.

**TRIAL OF AMERICAN AND ENGLISH ORDNANCE.**—The *London Engineering*, gives an account of some experiments made with an American 15-inch smooth-bore gun, and an English rifled 9-inch gun, against a solid target covered with iron armor eight inches thick. The greatest effect produced by the first, with a charge of sixty pounds of American powder, and a steel shot weighing 498 pounds, was an indentation of 8 1-5 inches, while the English gun sent a chilled iron shell, weighing 250 pounds, into the same target 19 1/2 inches, with forty-three pounds of English powder, making a hole eleven inches in diameter.

**FIFTY PHOTOGRAPHS AT ONCE.**—Mr. Helsey, of Liverpool, has, it is said, invented a machine by which he can take fifty photographs simultaneously.

#### Mechanical.

##### Tungsten Steel by the Bessemer Process.

Since the notice to the communication of Talpa was written, which appears in this day's Notices to Correspondents, respecting the possible use of tungsten, we have received the last publication of the *Journal of the Franklin Institute*, in which appears the following article, by which it would seem that many of the points on which we have only theorized, have been made practically available.

We translate from the *Comptes Rendus*, page 609, the important parts of a note by M. Le Guen:

"The superior quality of steel made of wolfram is well known; it is only desirable now to make it in large masses. I have succeeded in doing this by the Bessemer process, at the steel works at Imphy. The steel was made as usual, taking 3,200 kilogrammes of a gray iron which is known to make the best steel, by the addition of 400 kilogrammes of a white laminated iron—the spiegel-eisen—which is obtained in Prussia, being, after fusion in the reverberating furnace, decarburated in the converter. Then, instead of spiegel-eisen, we added 400 kilogrammes of an ore containing tungsten. We thus obtained a steel capable of being tempered and forged, and which was well laminated. When made into railroad iron, wagon-springs and sheet iron, it has resisted severe tests.

I here give the result of my experiments:

1st. That you can use the Bessemer process to combine tungsten and steel.

2d. That the loss of tungsten, found by analysis, is comparable to that found in other processes previously tried.

3d. That an ordinary, even rather impure, gray coke iron has become, when treated with wolfram, susceptible of transforming into steel of good quality the decarburated metal in the converter, which opens a vast field for research and employment of irons which are likely to give steel of any desired quality.

4th. Finally, by means of this method, it is possible to obtain pieces of Bessemer steel made by tungsten."

**DRILLING MACHINES FOR TUNNELS.**—One great difficulty which has been felt by most inventors of these machines, has been in making them self-adjusting, as regards the feed—and at the same time sufficiently strong. Prof. Wood, of the University of Michigan, with his associate, Prof. Robinson, have, it is claimed, invented an arrangement which entirely overcomes the difficulty. If this be the case, a great point will have been gained; for the question of abandoning all attempts to perfect machines for this purpose, and resorting to hand-drilling only, has been seriously discussed, in reference to the Hoosac Tunnel. The defect to which we have alluded, was the cause of such frequent breakage of drills, as to make it a very expensive matter to keep up the supply.

**TRUE PLANES.**—Mr. Whitworth has offered to deposit in the South Kensington Museum, "to be there perpetually preserved, three original true planes, and a measuring machine or instrument demonstrating the millionth part of an inch." He also proposes to make a sufficient endowment, subject to conditions, to provide for the delivery of lectures to explain such instrument.

**TEMPERING STEEL CUTLERY.**—An English patent has been taken out by a Mr. Newton, for a new mode of tempering the steel portions of cutting instruments previously welded on iron. A drop-die is allowed to fall upon them while they lie upon an anvil block. The blow, together with continued metallic contact and the waves, or "shiverings," of motion caused by the reaction of the foundation of the anvil, effect the end.

**STEEL IN THE UNITED STATES.**—A company in Vermont is establishing works for the manufacture of steel locomotive tires. In Troy, New York, preparations are being made for the making of steel rails. The Bessemer Steel Works in that place are expecting soon to turn out fifty tons of steel per day.

**MANUFACTURE OF STEEL.**—An invention has recently been patented by Mr. V. Gallet, of Lavauseau de Benassais, France, the object of which is to facilitate the manufacture of steel. He proposes to take iron, by preference such as has been submitted to one rolling operation only—puddle bar—and to coat it with a paste made by mixing water with the following ingredients: Carbonate of lime, 37 parts; vegetable mold or clay, 13 parts; carbonate of potash, 10 to 20 parts; oxide of manganese, 3 parts; resin, 3 parts; soot, 10 parts; wood charcoal, 40 parts; and common salt, 1 to 3 parts. The iron coated with this composition is melted in a crucible, and cast steel is thus obtained from iron in one operation. The proportions in the composition may be varied, and the vegetable mold and the soot may be omitted. In order to prepare steel by the process of cementation, he employs the same composition in a dry state, (or it may be moistened) and conducts the process in the manner usually practised in preparing steel by cementation. The quantity of cement necessary to coat the fragments of iron varies from 2 to 7 per cent. of the weight of the iron, according to the nature of the iron and the quality of the steel that it is wished to obtain. The object of the invention in the case of cast steel is to supersede cementation in furnaces to purify the iron, and to combine it chemically with wood charcoal by the cementation which takes place in the vessel in which he makes the steel. Charcoal having very little affinity for iron requires, in order to cause it to enter into intimate combination with it, to be increased at a stated time, and to be aided in its combination by numerous electric currents; these conditions Mr. Gallet claims to have entirely fulfilled by his process, since—firstly, the mutual reaction of the carbon and the carbonates produces a greater proportion of carbon and takes a smaller determined proportion; and, secondly, the change of the carbon and the carbonates, the action of the hot iron upon the resin, and the aluminous oxides of potash at a stated time, engenders or produces numerous sources of electric currents; ultimately the alkaline metals appear at a stated time, and absorb with avidity phosphorus, sulphur and the other metalloids. The alkaline and earthy bases pass to the scoria.—*London Mining Journal*, Aug. 3d.

**DRILLING MACHINES.**—In a description of the Iron Works of Hewes & Phillips, Newark, N. J., the *Artisan* has the following:

The drilling machines constantly seen in machine shops are frequently faulty in construction. The belt cones are placed at the top, and the base of the machine is often disproportioned to the table on which the work rests or is secured. The consequence is that when a small drill and quick speed are used the drilling machine shakes, and the holes drilled are "out of truth." The weight in a drilling machine should be thrown as much as possible into the lower part, and a good wide heavy base will tend to keep the machine steady without the application of iron rods and braces for that purpose. All the drilling machines at the works of Hewes & Phillips are attached to some of the cast-iron columns supporting the floors. These columns are finished all over. The table is made so as to be raised, lowered, or swung round at pleasure. These machines are very steady in their action, economize the space in the rooms, and work of all descriptions can be put under them and drilled. For heavy work there are some very large and strong drilling machines, which are placed transversely between the columns. A strong and heavy casting, fitted up and finished similarly to the cross-slide of a planer, extends from one column to another in the center of the room. This casting is fitted to the two columns, and the casting can be raised or lowered by power. Upon this cast cross piece are two boxes with the gearing, spindles and adjusting gear all attached. The whole is so arranged that a hole can be drilled at any angle. Under the cross-piece and drills and between the columns are placed two tracks on the floor, which allow the work and heavy castings to be brought on carriages and trucks directly under the drills, when one or two holes can be drilled at the same time, and at any angle indicated by the engraved index at the ends of the cross-piece. When the machine is not in use, the cross-piece or slide can be raised to such a height as not to obstruct the passages through the shop.

**A SIMPLE RULE.**—To ascertain the length of the day or night, at any time of the year, double the time of the sun's rising, which gives you the length of the night, and double the time of its setting, which gives the length of the day.

**THE SUMMIT TUNNEL** on the C. P. R. R. was opened through on August 30th.

[Written for the Mining and Scientific Press.]

## Letter from Kearsarge.

INDEPENDENCE, Inyo Co., Sept. 8.

EDITORS PRESS:—That you have not heard from me before, in reference to this part of the country, is because I have been waiting for developments which I hoped to see made. You know I like to be accurate, and if I say little, I wish that little to have at least the merit of being true.

## SILVER SPROUT COMPANY.

The state of affairs here is not so favorable as might be wished; yet there is no real cause for discouragement. The Silver Sprout Co. has committed the error, against which it was forewarned, but of which it is not yet convinced, of attempting to treat their ores by the common methods, in iron pans, without roasting. The result, as might have been expected from that of all similar attempts in this district, was a failure. The proportion of these ores which can be so worked is very small, and is confined to the superficial portion of the veins. From present indications, this company is apparently disposed to repeat the experiment with, I venture to predict, precisely the same conclusion. However, as it is paying its way honestly, and is determined that none but itself shall lose by the operation, it is entirely its own misfortune.

The ores of this district have never yet been successfully worked in that way, although dozens of attempts have been made, in the various mills and arastras about here; the few apparently exceptional cases being readily traceable to equally exceptional causes, such as unusual richness of the ore, or a special course of treatment between crushing and amalgamating, requiring time.

The Silver Sprout company, after a temporary suspension of operations, is about to resume with vigor the work of opening the mines and completing the mill, which, when finished, will have ten stamps, three Wheeler and six Wakely pans, with a due proportion of separators, etc., lacking nothing but reverberatory furnaces to treat the ore as well as it can be done anywhere.

The mines of this company are situated very high up in the mountains, and are rather difficult of access, which retards their development; yet the time will come when the steepness of the mountains will be an advantage, rather than the reverse, as a tunnel can be run which will cut the veins more than a thousand feet deep. At the slight depth yet attained, the ores are considerably decomposed. The principal silver mineral is a more or less altered arsenical sulphuret of silver and lead. Occasionally the cubical crystals of pure silver glance are found; also a peculiar kind of iron pyrites, galena, various arsenides, oxides and carbonates, a little chloride of silver and lead, and rarely the dirty yellow annular crystals of "murio-carbonate" of lead are seen. The gangue of these veins is quartz. It is too soon to pronounce an opinion as to their permanency; nor are they yet in a condition to yield any considerable quantity of ore for working. The most promising of the series is the "Mountain Sheep," which is about five to seven feet wide, and as well defined a vein as need be, but, so far, not exceeding rich. The Silver Sprout, though richer, is neither so wide or well defined.

## THE KEARSARGE COMPANY

Have a very fine mill of ten stamps, and six Wheeler pans, etc. It is arranged for wet crushing, but can be easily altered for dry work. It is well built, well arranged, and remarkably roomy mill, better located than the other, and like it wants only furnaces to make it complete. A curious, to me unaccountable thing about this mill is, that it is driven with a steam engine, although one of the finest water powers in the world—a thousand inches of water, with, if required, a thousand feet of fall—runs by the very door. The ores of this company's mines are very similar to those described above; but, from being more decomposed, and containing more chlorides, they yield better in the pans. They also yield more lead, inasmuch that, unless special means are used to prevent it, the bullion obtained is of a very low grade of fineness. I am particular to state this, because no less than three

analyses of these ores, made in San Francisco, not only ignore the presence of lead, but distinctly affirm its absence; notwithstanding which it is readily detected in the ore by means of the blow-pipe. I will send you a sample if you wish it. [We should be pleased to receive samples of ores from this district, with full description, for our Cabinet.—Ed.] These ores contain, by my assays, from \$100 to \$1,600 per ton in silver, and as high as \$175 in gold. I do not speak of specimens, but of tons.

But the mines are not yet thoroughly opened, and until they are it would be folly for this, as it is for any other company, to expect important returns. Fortunately for itself, this company has had the good sense—as rare as it is commendable in a G. & S. M. Co., notorious as they are for folly and mismanagement—to select a superintendent who knows his business, and, having so done, to trust him to do it. Mr. J. B. Low is carrying on the operations of the company with vigor and discretion, with all the economy consistent with the due prosecution of the enterprise, but with the full understanding that it takes money to work a silver mine. He also comprehends the requirements of the ores, and as soon as the mines are sufficiently developed to justify it, will complete the requisite appliances for their reduction. The company could not have sent a better man for its own interest, and that of the country, with which latter I am more concerned. This, at least, is my opinion; if I find myself mistaken, I will let you know.

## THE PIONEER MILL.

In addition to the two mills mentioned, there is the "Pioneer," a small affair, with four light stamps, a pan and barrel, driven by water. It is now idle, and sadly out of repair.

There is also an arastra, operated by Mr. Wood, who amalgamates in a harrel, after grinding.

## THE RESULTS

Obtained in working ores in this district have been, and are, most deplorable as a rule; notwithstanding which I consider these ores rather docile than otherwise, especially as compared to those of some parts of Mexico. The whole difficulty lies in the fact that there are, as yet, no works provided with suitable means.

There are very many veins about here, all very similar in their mineralogical character to the foregoing, and I have no doubt some valuable mines will be found when they are thoroughly prospected. The mountains are high, and of the most rough and craggy description, and the veins seem to run in the most inaccessible places; but the ores are rich, the climate is excellent, there is abundant water-power, wood at \$8 per cord, lumber at \$70 per M, and the most fertile valley I know of on this side of the Sierra Nevada, where vegetables and grain can be, and are, raised in plenty.

Next week I expect to visit the celebrated Lone Pine country, and will give you the result of my observations. C. H. A.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

FIELD'S FIRE-PROOF ROOFING AND PAVEMENT Co.—San Francisco, Sept. 20th. Capital stock, \$25,000; 1,000 shares, \$25 each. Trustees: S. P. Leeds, James Chaplain, James A. Hope, George H. Russell and A. C. Dodge.

ELECTION OF OFFICERS.—COSALA S. M. COMPANY.—Sept. 16th. President, J. Mora Moss; Secretary, Chas. Baum; Treasurer, Bank of California. Office, 510 Battery st.

GRAIN AT THE WEST.—The grain trade of Buffalo, N. Y., twenty-five years ago, was between two and three millions of bushels yearly. On a single day, during the past year, the receipts at that port reached the largest quantity above named.

QUADRICHLORIDE OF CARBON.—This is a new anæsthetic agent which has recently been experimented upon. It is said to produce its effects in much less time than chloroform or any other substance which has been used for the purpose. It has the odor of quinees. Its use is not followed by nausea, or any other disagreeable symptom.

AN ABUSE CORRECTED.—We are glad to learn that officers are now stationed to board in-coming vessels, for the purpose of preventing their invasion by sailor boarding house runners, until permission is given by the captain. This is as it should be.

## A New Mechanical Movement.

Among the novelties in the machinery department at the Fair was Redstone's Patent Sawing Machine, which, it is claimed, will saw forty cords of wood per day, and can be run by horse or steam power. This saw was manufactured at the Union Iron Works, Sacramento, and costs \$125. Visitors were very much pleased with its performance, and expressed much surprise at its novel and simple, yet effective arrangements. The work is accomplished by quite an ingenious and novel mechanical movement, which we have not space at the present time to fully describe. By it, it is claimed, that large trees may be readily and easily felled, and cut close to the ground. It is especially serviceable in cutting up logs into convenient lengths or blocks, as for firewood, shingles, rifles for sluice-boxes, etc.

This saw cuts both ways, and appears to be the simplest form of a machine for a farm or for use in the woods that we have ever seen. Circular saws must be driven at a certain speed, or they will not cut at all; but this machine can be driven at any speed, and will do work proportionate to that speed. It is almost impossible for it to get out of order. It is an American invention, which, besides its extensive introduction into the Atlantic States, has also been largely introduced into England.

The advantage of this device for sawing, or for any employment on any shafting, for changing rotary into reciprocating motion, will be seen in the fact that while it serves the purpose of producing a direct line, usually effected by a cross head, it also adapts itself to the cut of the saw, as it descends, in sawing, always preserving a strict motion over the cut; thus avoiding the long attachment which is usually employed in connection with a cross head and pitman.

By this device they have accomplished what has never been accomplished by any other arrangement. In short, an *absolutely new mechanical movement is thereby effected*—the first which has been produced for the last thirty years, even during the present activity of inventive genius. Mr. Redstone also exhibited the model of a steam engine with this attachment, instead of the ordinary cross head, of which honorable mention was made in the report of the committee. A shingle machine, also by the same inventor, was reported as worthy of especial consideration for originality of design and apparent utility.

## [COPY.]

SPRINGFIELD'S OFFICE, GOULD & CURRY S. M. Co.,  
Virginia City, Nev., Sept. 17th, 1867.

JOSHUA HENDY, Esq., San Francisco:—  
Dear Sir:—According to the terms under which I secured from you four (4) of your concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value, I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the company. You will please present the bill for said concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours very truly,

LOUIS JANIN, JR.

We are told by Mr. Hendy that the bill was presented in accordance with the above request, and duly paid.

Mr. H. also informs us that the order of five of his concentrators for the Empire mill, Grass Valley, noticed by us last week, has been increased to six. [Eds. Press.]

MICRO-CHEMISTRY OF POISONS.—An interesting volume on this subject has been published by Professor Wormley, of Capital University, Columbus, Ohio. He uses the microscope for the examination of the various minute crystals which are produced by the action of re-agents upon the various poisons.

It is said that the number of patents annually issued by the United States is three times greater than that of Europe. More than 200 patents a week have been issued at Washington for the last six months.

## AN INSTRUCTIVE BOOK!

Prof. LAYRES'

## ELEMENTS OF COMPOSITION,

## BELLES-LETTRES AND ORATORY.

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

## RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Seely.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hall.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the whole sentence, and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text-books.—James Deanna.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Lund, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brighton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the forum.—John Garry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. \* \* \* Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boate.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times.

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes—or rather, he should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Maryville Appeal.

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

PRICE, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Travelling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco. 6v15-1f

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING, September 21, 1867.

CITY STOCKS.

The dullness in city shares we have noted for some time past has continued during the period under review. No desire is manifested to invest in them under the present violent changes the mining share market is undergoing, and the transactions coming under our notice are confined to a limited number of stocks.

The annual meeting of the stockholders of the Bank of California will be held at the banking house on Tuesday, the 1st of October next, at 11 o'clock A. M.

The receipts of the local insurance companies during the first eight months of 1867, according to the returns made to the Internal Revenue Department, on a currency basis of 72 cents, have been as follows:

Table with columns: COMPANIES, August, Previously this year, Total. Includes Pacific, Union, National, etc.

The aggregate increase of receipts in August over July is \$56,497.

The receipts of the city railroads for the month of August and previously this year have been as follows:

Table with columns: August, Previously this year, Total. Includes Omnibus, North Beach & Mission, etc.

The aggregate decrease of receipts in August as against July is \$2,271. The North Beach and Mission Road has gained the head of the list. The receipts of this company prior to the opening of the City Gardens were generally from \$4,000 to \$5,000 less per month than the Omnibus, but are now in excess, and the only company that shows any gain in August over the receipts of the previous month.

Mining Share Market.

The mining stock market continues active. Within the past week the "bears" for the most part controlled the operations; however, on Wednesday and Thursday, in the open board, the "bulls" managed to raise Crown Point, Kentuck and Yellow Jacket to higher prices than had been previously obtained. The present unsettled state of the market produces extremely fluctuating prices irrespective of the condition of the various claims. Speculative transactions in various leading stocks have been made upon an extensive scale.

HALE & NORROSS—experienced a very marked depression during the period under review, falling from \$1,400 to \$1,000 per foot, and then selling at \$1,100 s. 30. We are informed that the ore extracted between the 700 and 780 feet levels during the current month falls short of the average yield per ton in the month of August. This may be but temporary, since we have a parallel case in the yield of the months of March and April of the present year, when the average was very nearly as low, but subsequently regained the former standard of quality. During the first half of the present month 1,473 tons of ore were extracted from the mine. The new shaft is now about sixty feet in depth below the 780-foot level. Further developments are being made on the 300-foot level, and they are thoroughly prospecting the 175-foot level, a work which has been neglected on account of the full employment of the hoisting works in taking ore and waste from a greater depth. Owing to the present heavy expenses of the company and the decreased value of the ore, no dividend is expected in the month of October. In this connection we mention the fact that this company, since March, 1866, paid to its stockholders \$790,000, equal to \$1,975 per foot, in the shape of dividends.

CROWN POINT—has fluctuated very materially under quite active influence, opening at \$750, dropping to \$525, rapidly improving to \$830 in the open board, receding at the regular session

to \$720, and closing yesterday at \$715. We learn that on the 19th inst. the main shaft was 87 feet in depth, and that the south wize from the 600-foot level was down twenty-six feet, and reported to continue in very good ore. The quantity of ore taken from the 600-foot level has increased considerably of late. A sufficient amount is extracted from the mine to supply the Rhode Island Mill, the reduction capacity of which is 1,500 tons per month.

CHOLLAR-POTOSI—sold to a large extent, declining from \$335 to \$285, rapidly rising to \$347 50, and closing at \$334. The ore from the Blue Wing station assays \$20 to the ton, an improvement of \$3. The New Santa Fé level is yielding about thirty tons of ore per day, with prospects of an increase; and the vein on the third Santa Fé level is worked to a width of eighty feet; the old works, altogether, producing at present about 400 tons of ore per day. The new shaft is nearly 900 feet deep, and at that depth they reached the west wall of the ledge. The fifth station is being opened at a point twenty-five feet from the bottom, or at a depth of about 875 feet. During the week ending Sept. 13th, 2,223 tons of ore were sent to custom mills.

SAVAGE—continues to attract the greatest attention, and the sales during the week have been very large, falling from \$147 50 to \$115, improving to \$145, then selling at \$136, and closing at \$144. During the week ending Sept. 14th, 1,631 tons of ore were taken from the mine, showing an approximate value of \$68,747 in bullion, or \$42 15 per ton. Of this amount the north mine, on the seventh level, yielded 848 tons, and the middle mine, same level, 324 tons. This decreased product is due to the interference of the cave, which is but partial in the north end of the middle mine. At the north and south ends the caving has been complete, and work has been resumed at these points. We learn that the breasts on the third station, near the winze from the second station, show twenty-five feet of ore which is reported to be of an average quality. The east drift from the bottom of the incline winze (north mine, seventh level) has developed twelve feet of ore which assays \$45 to the ton.

KENTUCK—has been in the market to a considerable extent, opening at \$165, declining to \$155, advancing to \$230 in the open board, and closing yesterday at \$200. The bullion sent to the office in this city from the 1st to the 18th inst., amounted to \$54,922 91, and it is believed that the returns for the present month will exceed any previous like period.

IMPERIAL—is in better favor, improving from \$135 to \$142 50, and closing at \$143. Receipts of bullion from the 1st to the 19th inst., aggregate \$35,262 73. OPHIR shows a slight improvement, a few feet selling at \$71@80. The new shaft has attained a depth of 79 feet.

YELLOW JACKET—exhibits a marked advance, improving from \$380 to \$530, then selling at \$440, and closing at \$450. It is said that a fair body of ore has been developed in the west drift of the fourth mine. The shaft is being carried to a further depth of 200 feet.

OVERMAN—declined from \$62 to \$37, rallied to \$57 50, and closed at \$55. Both the 300 and 400 feet levels are yielding ore, but the quantity is not stated. On the 16th inst. bullion to the value of \$3,000 was forwarded to the office in this city. It is thought that this month will show an increased yield. During the month of August 1,232 tons of ore were extracted and 834 tons reduced. This company has \$43,000 on hand at this date.

ALPHA—realized \$450@475 per foot. GOULD & CURRY sold at \$320@300, then at \$305. GOLD HILL QUARTZ at \$75@80. BELCHER opened at \$95@73, then sold at \$92 50@82 50. BULLION at \$18@29 50, closing at \$23. JUSTIA AND INDEPENDENT advanced from \$12 to \$16, and closed at \$11. SIERRA NEVADA sold at \$8@5, and closed at \$7 seller 3.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last amounted to \$1,373,004.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1855-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents. Address, DEWEY & CO., Patent Agents, San Francisco, May 1st, 1866.

Electrotyping Cuts, Engravings, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DAY DELINQUENT, DAY OF SALE. Lists various mining companies and their details.

\*Those marked with an asterisk (\*) are advertised in this column.

Latest Stock Prices Bid and Asked.

S. F. STOCK AND EXCHANGE BOARD.

Table with columns: MISCELLANEOUS STOCKS, GAS COMPANIES, RAILROADS, BANKING INSTITUTIONS, INSURANCE COMPANIES, MINING STOCKS—WASHOE DISTRICT. Lists various stock prices.

San Francisco Market Rates.

Table with columns: Flour, Extra, 4 bbl., Do, Superfine, etc. Lists various market rates and prices.

Table with columns: Cheese, California, 1 lb., Eggs, 1 dozen, etc. Lists various retail prices.

San Francisco Metal Market.

PRICES FOR INVOICES.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

Table with columns: Iron, Duty; Pig, 50 per ton; Railroad, 60 per 100 lbs; Bar, etc. Lists various metal market prices.

THE BEST IN AMERICA.

The Mining and Scientific Press, Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO., Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes most valuable reading matter than any other weekly journal in California. To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. It files contain a record of the improvement in mining machinery, the progress and development of the mines, and all new methods and processes for working and.

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books. THE MINING AND SCIENTIFIC PRESS is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Mining State Convention, held at Sacramento, January 17th, 1866: 'RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the Mining and Scientific Press, San Francisco, to the consideration and support of the miners of the Pacific coast.'

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order. AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free. DEWEY & CO., San Francisco, A. T. DEWEY, G. W. M. SMITH, W. B. ZWIKER.

ENLARGEMENT OF THE

American Journal of Mining

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to Twenty Pages. This makes it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, mining and metallurgical machinery. The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America. The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, WESTERN & COMPANY, 175-181 Broadway, Publishers, 37 Park Row, N. Y.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Frost's Treatise.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Sept. 14th: The Alpine tunnel is running to open the ground adjoining the Tarshish, known as the Alert claim.

One day this week the workmen in the Morning Star north drift struck into an ore substance which is thought by some to contain gold, while others maintain that it is only the approach to another ledge.

We hear rumors of something good in the Mountain this week, but can find out nothing definite about it. It is expected any day to strike the lode.

*Calaveras Chronicle*, Sept. 17th: The Tarshish Co. have struck another heavy deposit of rich ore in their north drift about 75 feet from the main tunnel. Mr. Graf, the superintendent, has about 40 men employed on the claim. The kiln now in course of erection at Davidson's mill, near this city, for the purpose of drying the Tarshish ore preparatory to working it, will be completed within ten days, when the mill will again start up.

## Calaveras County.

*Chronicle*, Sept. 14th: Lamphear & Co. are meeting with the most flattering success in the prospecting of their quartz lead. At the depth of 120 feet the ledge is six feet wide, well defined and the rock will pay handsomely. The machinery with which the claim is at present being worked is defective and scarcely powerful enough to keep the water out and perform the other necessary operations. A steam mill will be erected this fall. Their claim is one of the best in the county.

T. S. Bever, Esq., proprietor of the "old Shields" claim, at Rich Gulch, has leased it to a company of capitalists who will immediately commence operations. They have rented the French Company's mill—ten stamps—and will put a large number of hands at work on the lead in a short time. Our quartz interests in this vicinity never looked so favorable as at present.

*San Andreas Register*, Aug. 14th: Dr. Southwell has erected a first-class quartz mill at Carson's of 29 stamps capacity, which is expected to be set running on the 1st prox. The most flattering results are confidently anticipated in the working of this mill, as the machinery is all good and the rock excellent. If expectations are realized there, it will give a fresh impetus to mining in that vicinity.

Work will be commenced again at once on the Calaveras mine at Copperopolis. It has been lying idle for about two years.

## Inyo County.

*Virginia Tresspass*, Sept. 16th: We have received a letter from Charles F. Duval, at Independence, Inyo county, Lone Pine Mining District. The furnaces are being erected wherewith to smelt the rich ore, and will be completed soon. The Virginians are delighted with their ledges and prospects.

*Dutch Flat Enquirer*, Sept. 11th: Dr. Dozier has just returned from Owens River country. He finds a splendid opening and the company have decided to erect monster works at once. The Dr. feels confident that he can get double the amount of silver from all classes of ore obtained in that region. First-class ore that now yields \$700 per ton can be made to pay \$1,500 by the new process, and second and third-class ore will also pay well to work. The whole cost of reducing will not exceed \$100 per ton. When the new works are erected from five to ten tons per day can be reduced.

*Visalia Delta*, Sept. 11th: The Owens River country is going ahead rapidly; new discoveries and rare developments occurring almost daily.

## Mendocino County.

*Marysville Appeal*, Sept. 18th: Mr. Geo. W. Squires, who resides on the south side of the Buttes in Sutter county, exhibited to us yesterday some specimens of the richest copper ore we have ever seen in California. While hunting in the Coast Range, Mendocino county, he came across a ledge of copper ore which, if the specimens we have seen are a fair criterion, is certainly the richest ever found in the State. He represents the ledge as being from 30 to 35 ft. in width and of great length. The croppings from whence the specimens were taken is from 20 to 25 ft. above ground. Good judges here pronounce it the richest copper ore ever exhibited in this city. The ledge discovered by Mr. Squires is about 90 miles from Marysville.

## Nevada County.

*Transcript*, Sept. 12th: The Grizzly ledge, located on Devil's Cañon, near the Magenta

Flume, was purchased some two years ago by J. M. Pattee, of the Eagle Company of Connecticut, and has since been worked steadily. A five stamp mill was erected and several openings made on the ledge. The last run of twelve days in this mill gave a yield of \$1,200, or \$100 per day. The ledge is so large and the rock so easily obtained that at this rate it can be most profitably worked. It is the design of the company to add five more stamps to the mill, and should the new level continue as good as where they are now working, a steam engine will be put up and the mill kept in operation all winter.

Sept. 15th: The shaft in the Scandinavian ledge is now 45 ft. deep, and a drift has been run upon the ledge 30 ft. The lead is two feet wide with a rich pay seam of six inches running through it, in which gold can be seen in abundance, without the aid of a glass. Some 40 or 50 tons of rock are already out, ten of which are of a very high grade. No mill test has yet been made, but miners declare that the rock will yield first-rate pay.

In the Oceola claim, at Rough & Ready, the ledge has been struck 60 feet below the surface. The lead is 15 inches thick, and sufficient rock will be taken out next week for a test by crushing.

Sept. 17th: The storm which commenced on Saturday morning and continued until early Sunday morning, did considerable damage on Deer creek, in washing away dams and filling up diggings.

*Gazette*, Sept. 13th: One hundred tons of rock from the Fidelity ledge was recently crushed at the Tecumseh mill, yielding about \$1,400. The claim is on the Yuba river, about five miles above Omega. The ledge is large, well defined, and has a favorable reputation.

Some fine specimens of gold-bearing quartz from the Cunningham mine has been exhibited by John Pattison, the superintendent. The specimens were taken from the bottom of the incline now being sunk, and contain much free gold and sulphurets. The incline is now down to a depth of 250 feet on the slope of the ledge, and will be sunk 50 feet deeper when another level will be run. The ledge at the bottom of the incline is about 18 inches wide, and the rock looks better than any ever before taken from the mine.

Sept. 16th: The editor, in speaking of the different companies now at work at Relief Hill, says: The Independent mine is one of the best mines in that vicinity. The tunnel is in 100 ft., and two wing tunnels of 100 ft. each are completed. During the past year the mine has been worked with good success, paying considerable more than working expenses, which are heavy. If this company can work off 100 feet front on their mine every year, which is a liberal estimate, it would require 100 years to exhaust their claims.

The Eagle Co. have just commenced washing through their new tunnel and shaft. They employ 400 inches of water, 12 men and three pipes. The latter have a pressure of 225 feet. The mine is owned by eight different parties. Before they run their last tunnel this mine paid its owners well, and its present prospects are better than ever before.

The North Star Co. and Aaron Davis & Co. employ 12 men and 300 inches of water each. They do most of their work by blasting, and loosen their ground so thoroughly by this agent that they require a less amount of water to wash it away.

Three or four other companies, also, are successfully at work at Relief Hill, on a smaller scale, however, than those we have above noticed.

Altogether, about 80 men are employed in these mines. They take out more gold and wash away more gravel than two thousand men could without the aid of powder and hydraulic pressure.

*Gazette*, Sept. 16th: Dr. Farnham, of San Francisco, has recently purchased an interest in the Downer claim at Chalk Bluff. The ground was located last February by A. J. Downer. The Doctor has sunk a prospecting shaft on the claim to the depth of 30 feet, and the gravel prospects about three cents to the pan.

*Marysville Appeal*, Sept. 15th: Gen. O. Evans & Co., at the last clean up of their mining claim, at Buckeye mill, Nevada co., took out, after a four weeks' run, something over \$22,000 of gold dust. These are the best hydraulic mining claims in Nevada county.

*Excelsior*—Meadow Lake *Sun*, Sept. 10th: The Green Emigrant Co. cleaned up the batteries of the California mill, where they have been crushing their ore. From 84 tons of rock crushed, nearly \$3,000 in gold was obtained. The company have nearly six tons of sulphurets, which they saved from the rock crushed, which, when

worked, will pay not less than \$100 per ton. The Green Emigrant boys have lots of ore fully as good as that which they have just crushed.

The Mohawk & Montreal Co. sent the bullion which we mentioned a short time since as having been cleaned up from their mill, to Virginia. The ore crushed was of a sulphuret character, and the amount of bullion returned was \$789. They have a large quantity of very rich sulphurets saved from this run, which will increase the yield to nearly if not quite three times the amount of the yield in free gold. They will make another clean up about the first of the coming week.

The Gold Run Co. is now getting out some fine ore, which they will have crushed at the Mohawk & Montreal Co.'s mill. They expect that it will pay handsomely. The company are in hopes to make their ore pay the expenses of developing their mine, henceforth.

## Placer County.

*Herald*, Sept. 14th: On the Green Emigrant, McCarty & Lowry, about two weeks ago, sunk a hole about 500 ft. northwest from where the lead was first discovered and prospected. They found the rock exceedingly rich, and the rock we saw was literally covered with gold. The vein proves to be a regular fissure vein, lying between the slate and granite. The slate being the foot wall, which is 100 ft. wide, and will itself average \$15 to the ton.

The vein in the Montezuma claim varies from 10 in. to 2½ ft. in width, and is rich in gold. The rock is blue, as well as the casing. The quartz assays \$100 to the ton. There is 600 ft. in the claim.

Mr. Walls, formerly of Butte county, has recently discovered a rich ledge about a mile northeast of E. N. O'Brien's house, and about three miles from Auburn. It bids fair to be a good paying vein.

There are several recent locations made on the famous Black ledge. The first was made by McGonigle & Co., who are getting excellent prospects, and still running on the main lead.

Lawlor & Co. have the first extension north. They have struck the ledge 3¼ ft. thick.

Adjoining them is the Buckeye Co., who have struck the ledge 3¼ ft. thick. The working test of the rock is \$40 per ton.

The next claim belongs to Curry & Co. They have struck the main ledge which is well defined, and taken out some very fine specimens.

The ledge is six or seven ft. thick. The rock shows plenty of sulphurets and free gold.

## San Bernardino County.

*Guardian*, Sept. 14th: The placer mines in Holcomb Valley are doing very well now. The rains and storms have all passed away, and the men continue their work without interruption.

The claims on Lytle Creek are yielding well just now, many of the boys turning out from \$5 to \$15 per day. The red dirt is paying well, and there is no doubt but the project of bringing in the water to work all the gold bearing land, will be one of the most important for that section of the country, as well as remunerative to the enterprising projector.

## Sierra County.

*Downville Messenger*, Sept. 14th: Some parties prospecting near Excelsior, have obtained splendid prospects in an abandoned tunnel, and believe they have found a continuation of a very rich lead.

The Messrs. Kime are putting up a new quartz mill on the rich ledge discovered sometime since, near the Buttes. The rock which is being taken out is very rich, and the prospects for a paying mine are excellent.

It is reported that the Fir Cap mine, situated about six miles from Downville, is paying enormously—about \$4,000 a week.

Messrs. Smith & Gray, of Gold Valley, have at last succeeded in reducing the heavy sulphureted ores of their ledge, and making them pay. They say they can save \$40, where they did not save one by the old method of working.

## Shasta County.

*Courier*, Sept. 14th: The Bamboo Co., at Marion Flat, have resumed work in their diggings, and are taking out excellent pay. The claims on Dutch Hill and Barker Hill are all paying good wages.

## Tuolumne County.

*Visalia Delta*, Sept. 15th: The Bull Run mine is worked by three different companies First, Ellsworth and Deland, are down over 300 ft., with a 5-ft. ledge; next claim on the west, Hutton & Co., who are also working at a depth of over 300 ft., with a large lode and rich ore; yet further west the Staples Co. are commencing operations, and intend putting up a 4-stamp mill. This mine now supplies 32 stamps; a new 16-

stamp mill just completed by Ellsworth & Deland, and two 8-stamp mills worked by Hutton & Co. We learn that Hutton & Co. are going to build a new 15-stamp mill this fall. These mines have been worked since 1863, and have paid on an average, \$30 per ton.

## Tuolumne County.

The Sonora *Democrat* says that Messrs. Jacks and Colburn, after two months' prospecting in the "Ruffletail" quartz claim, have struck rock that pays \$200 per ton. The claim is situated near Whitman's Pass.

## ARIZONA.

*Miner*, Aug. 31st: A. O. Noyes is sinking a shaft on the Senator lode; also one upon the Montgomery.

Messrs. Bowers, Rush and others, who have secured \$00 ft. on the southwest end of the Dividend lode, will begin work next week. The ore will be worked at the Ticonderoga mill.

Sagebrush Johnson has quit work on the Accidental, and gone to Wickenburg—or California. R. Wining and others, are running his water arastra, on Lynx Creek.

Col. Tyson is at work on the Sterling.

*Tucson Arizonian*, Aug. 31st: Mr. Rnsh and others interested in the Dividend mine, Big Bug Dist., are about commencing to work on it, and have leased the Ticonderoga mill. A shaft has been sunk 60 ft., and 60 tons of rock have been run through the Big Bug mill, yielding \$20 per ton in free gold, and the concentrations containing an average of 17½ per cent of rock, according to the assay of Mr. Berger.

The Arizona correspondent of the *Marysville Appeal* of Sept. 14th, writes: The mines here, instead of paying, are doing just the opposite.

## COLORADO.

*Miner*, Aug. 29th: A fine chunk of silver hullion, weighing 339 ozs., was on exhibition. It is from ore from the Equator lode.

Mr. Miner, by a sort of cheap process, is taking out some very nice little buttons of silver. His apparatus consists of a sheet iron pan, in which the pulverized ore is boiled with salt. It is then amalgamated by washing in a common gold-pan.

An assay of ore from the Watertown lode last week, gave \$6,000 per ton.

The New Boston lode, as work progresses, is proving itself one of the most valuable in the Territory. Immense masses of pure argentiferous galeua, weighing a half ton or more are constantly being broken up by the miners engaged in working it.

The Equator lode has been sold to Messrs. Carpenter & Simpson for \$3,000.

From 20 pounds of ore from the North American lode, 2 pounds and 13 ounces of fine amalgam was produced yesterday.

*Denver News*, Sept. 4th: Mr. Birdsall showed us a very fine specimen of silver ore lately, from the Great Bear lode, situated in East Argentine. It had been warmed in a fire and showed large globules of silver.

Mr. Richardson, of Georgetown, exhibited in our office a fino bar of metal, taken from ore from the Argentine lode. It weighed 35 pounds, and was taken out by his new process.

There is on exhibition at the First National Bank, three bars of silver from Garrett, Martine & Co.'s works at Georgetown. The smallest one was from Bethany ore, weight 119 85-100 ounces, fineness .924, and valued at \$142.62. The second weighed 166½ ounces, fineness .921, and was valued at \$197.83, also from Bethany ore. These bars were worked in their chloridizing furnace. The third and largest, was from Nickolls ore, fineness .996, valued at \$541.50, and was smelted out.

From 1,600 pounds of ore from the Equator lode, Dr. Johnson lately took out a silver button weighing 599 ozs. 4 pwts., valued at \$1,151. In addition to this, there is a small brick of metal not yet cupelled.

A bar of gold was to be seen at the Colorado National Bank this morning. It weighed 150½ ozs., fineness .825½ gold; 169 silver, and was valued at \$2,601.10.

*Times*, Sept. 3d: This week 15 tons of second-class ore was run from the Smith & Parmalee claim on the Gregory, and the bar as stamped gives the following result: 47 and 28-100 ozs. gold, .864 fine; silver, 110 fine; specie value—gold, \$844.54; silver, \$6.62—total, \$851.16, or nearly \$57 per ton. The assay was \$69 per ton, so that the precious metals saved were to the value of 83 per cent. of the contents of the ore as shown by assay. Messrs. Reese, Krause & Bruckner are now running on first-class ore from the same claim, and will clean up early next week.

Outside of Clark & Co's bank may be seen a large piece of ore from the Sensenderfer claim, on the Bohtail. It is said to weigh 1,800 pounds. It is a splendid sample of pyrites, entirely free from flaw or mixture, and is a good evidence of the strength of the vein. It is valued at \$300.

*Transcript*, Sept. 4th: Mr. John Turck and his associates have just had 1,872 pounds of ore from the Crator lode reduced by Messrs. Garrott, Martine & Co. It yielded 831 ozs. of silver, worth in currency \$1,122.

The gold product of the Black Hawk Co's works were as follows: First week, 301 ozs.; second week, 314 ozs.; third week, 318; fourth week, 357. Total, 1,012 ounces.

It is rumored that the W. H. White lode was sold last week for \$25,000, to parties in Philadelphia.

Both of the reduction works at Georgetown are running night and day to their full capacity, which is only 13 tons in 24 hours. There is probably now less than 150 tons of ore being raised daily in the district.

Four men sluicing at the foot of Spanish Bar, cleaned up on Friday evening last \$840, the result of one day's run.

Garrott, Martine & Co. run last Saturday 3,600 pounds of Nuckolls ore, from which they obtained 150 pounds of silver amalgam.

#### IDAHO.

Owyhee *Avalanche*, Sept. 7th: Adam Assall and Wm. Pierson last week discovered a ledge on Florida Mountain, within sight of town. They call it the New Castle. It is 18 in. wide on top, yielding some very rich pay ore. They have gone down some six or seven feet, and have taken out some five tons of ore.

The Cosmos mill started up on Thursday morning under a contract with Messrs. Learned, McMahon & Herd to crush 60 tons of ore from the south extension of the Silver Cord mine.

Salmon City *News*, Aug. 23d: Douglass & Nichols, whose claim is on Nappies creek, at the mouth of Smith's Gulch, had cleaned up \$2,400.

Judge E. T. Beatty took a nugget weighing \$24 from his claims on Smith's Gulch, Aug. 17th.

#### NEVADA.

##### Black Rock.

Virginia *Enterprise*, Sept. 11th: A 5-stamp mill has been ordered in San Francisco for the Black Rock mines. It will cost upon the ground about \$3,000 per stamp, and will be running by the 1st of January next. The result of the various experiments at Dall's mill, Washoe, upon several varieties of ore was most satisfactory, the yield being from \$170 to as high as \$350 per ton. Mr. Isenbeck, the gentleman who conducted the experiments, is said to be the only man in the State who understands working the peculiarly intractable ores of Black Rock. About 30 tons more of the rock will shortly be brought in from the mines to be worked at the same mill.

Marysville *Appeal*, Sept. 15th: Black Rock ore, from the Emerald lode, has been worked to the astonishing figure of \$300 per ton. Isenbeck is also working ores from the Louisiana and Black Prince lodes, which promise a yield equal to that from the Emerald.

The Downieville *Messenger* of Sept. 17th, says that R. A. Cochrane, formerly of that place, has returned from a long tramp to the Black Rock mines in Nevada. He entertains, however, a very high opinion of the mineral richness of that country, and says its development is only a question of time; expresses the opinion that there is a fortune there for every man who will go after it in the proper manner. The minerals are found in an altogether different formation from anything ever heretofore known to mineralogists, and the ordinary processes of treating ores has no effect on it. He says that the gold is held in the form of a mineral salt, and claims that there is a method by which it can be extracted.

The editor of the *Reveille* of the 14th inst., speaking of the character and extent of the Black Rock mines, says: The ores do not require roasting, but may be worked by the common pan process. Some of the leads tested are nearly 200 ft. in width, and can be traced for miles. A width of eight feet is considered narrow for a lead in that country. The range abounds in crystals of all kinds, desirable as specimens for cabinets; common opals, agates and curious petrifications also abound.

##### Esmeralda.

*Trespass*, Sept. 16th: Wm. W. Bourne, of Pine Grove, Wilson Dist., arrived in Virginia Saturday evening, bringing with him 385 40-100 ozs. of bullion, principally gold, which being assayed by Ruhling & Co., weighed 383.60 ozs., is .344 fine, and worth in gold \$6,696.62. This bullion is the proceeds of 77 tons of ore extracted 50 ft. beneath the surface, from the claim of the Midas Co. The Midas and Wilson joint tunnel has been run 550 ft. At a distance of 300 ft. from its mouth a clay wall was cut, 2½ ft. thick, and similar to the east clay of the Comstock lode. Back of this clay, 200 ft., a vein of gold sulphuret-bearing ore, eight ft. wide, was cut, less broken than the ledge overhead, and returning assays of \$68

per ton. The ore from which the bullion was obtained was mined from a tunnel and incline, near the droppings, the vein being about two feet in thickness at that point. The ore was worked at the Pioneer mill, and it is the opinion of Mr. Bourne that the Pioneer works mineral-bearing quartz (gold) as closely as any mill on the coast.

The Wilson mine is yielding six tons of ore daily. H. C. Toombs, of Dayton, has a contract for ore from the east end of the mine, he paying to Wilson \$12 per ton for all mineral extracted. He is working several men, and the ore he has found will average \$75 per ton. From the mine proper a crushing of 100 tons will be made at the Pioneer mill, early next month. Mr. Wilson has made a contract with Palmer, Knox & Co., of the Golden State Iron Works, to deliver a 10-stamp quartz mill at Shingle Springs on the 20th of this month, and it is anticipated that the mill will all be in running condition by Dec. 1st.

Goodrich & Clark are taking out ore from the Wheeler mine on contract, receiving one-fifth net proceeds for their labor. They are working a soft, decomposed vein, and with four men are mining daily six to eight tons of ore which will work \$30.

The Burlesque Co's claim is yielding some ore which is being reduced in arrastras.

The Deposit Co. is working that claim, and crushing in the same mill as the first named company.

*Enterprise*, Sept. 17th: The Midas Co. will this month declare a dividend of \$4 per foot, and after the payment of the same will have left in the Treasury \$850. The ore reduced is being taken out at a depth of 50 ft. below the surface. The Midas and Wilson Cos. are running a tunnel to tap the vein upon which their claims are located, at a great depth. The tunnel is now in 550 ft. and has cut a vein of ore eight ft. in width, which assays \$68 per ton.

The Wilson Co., adjoining the Midas, are taking out ore that will average \$75 per ton, and have contracted for a mill which they will have running in December; meantime they have made arrangements for having 100 tons of ore crushed at the Pioneer mill. The Wheeler Co. are taking out six to eight tons of ore per day that will go about \$30 per ton. The Imperial Co. are at work upon a tunnel, the water having driven them out of their shaft. Their prospects are excellent. A lot of 1,900 lbs. of ore from the bottom of their shaft, worked by Mr. Delhi, yielded five ozs. of gold worth about \$90, or at the rate of \$100 per ton. The Ophir and Mountain View Cos., adjoining the Midas on the east, have excellent prospects. The lead crops out finely on their ground. In Washington Dist., Mr. Brooks is making rapid progress in the erection of his mill and will have it running in about a month.

##### Humboldt.

Unionville *Register*, Sept. 14th: Torrey's furnaces are being remodeled, and in a few days he will make a decided improvement in their working capacity, and will resume work upon a larger scale. His mines are turning out better than he himself anticipated. As his developments attain depth, the lead ores diminish accordingly. He is now taking out a large quantity of fine milling ore, as well as smelting ore.

Work has been resumed on the Alpha mine, in Echo Dist. They now have a vein of fine ore from three to five ft. in width, and have about 150 tons on their dump. Fifty tons of this ore was worked in Holt's mill, some time ago, averaging about \$75 per ton. One of the company has gone to San Francisco to secure a mill.

The Oreana furnaces are in full blast, and turning out bullion daily, with the most satisfactory results.

The Monroe mine, in Sierra Dist., is looking exceedingly well. A large lot of very rich gold ore can be seen in the ore house. The vein is growing larger daily. The Essex mine continues in the even tenor of its richness. G. W. Holt, the Supt., has a large force at work in the mine as well as at the mill. His machinery and lumber are now mostly upon the ground.

##### Reese River.

*Reveille*, Sept. 10th: Some 2,200 ozs. of crude bullion were brought into town yesterday from Coover's mill at Bunker Hill. The bullion was obtained from Victorine ore.

Sept. 11th: Mr. H. L. Hawes arrived in town this morning with about 1,000 ozs. of crude bullion from the Reveille Dist. The bullion was produced from eight to nine tons of ore from the Scorpion ledge, which were reduced without roasting.

The California mill has been leased by J. R. Murphy, who is preparing to set it in motion as speedily as possible.

This morning a part of the heavy engine and machinery from the Sherman shaft arrived in town, and was delivered on the ground of the company.

Yesterday Rnsell Scott showed us a fine lot of samples of ore obtained from a claim called the Brown and Spiker in Wisconsin Cañon, in the North Twiu River Dist. It is believed by many to be a continuation of the famous Murphy ledge, both from its course, general appearance, and the fact that the ore obtained from the surface of both locations is nearly identical. The owners have sunk upon the ledge to the depth of 16 ft., at which point it is large and contains several strata of rich ore.

Sept. 12th: Last evening Rnsell's stage from Cortez brought in 5,200 ozs. of crude bullion. The bullion was produced from ore obtained from the St. Louis mine, which was reduced at the mill of the Mt. Tenaho Co. A considerable lot of St. Louis ore of a high grade will be worked at the mill of the company.

The large engine of 100-horse power, for the Sherman shaft of the New York and Austin Co., was delivered on the ground yesterday, and will be placed immediately.

In Reveille Dist., the Desert Queen, which is situated on the east side of South Mountain, continues to yield very rich mineral, which the owners are reserving for reduction at the mill of the Old Dominion Co. at Hot Creek. Another ledge, named the Mountain Queen, in the same mountain below the Desert Queen, is also producing a good quality of fine ore. Brobant & Co. have several locations on South Mountain, which they are developing with good prospects. Work was about to be resumed on the Adriatic. Several of the ledges belonging to the Reveille Co. looked well and were yielding excellent milling ore.

The Rutland mill, of five stamps, is being negotiated for, and, if sold, will be rebuilt and supplied with roasting furnaces.

Sept. 13th: The Metacom mill is again under way, and is reducing ore from the company's mine of that name, as well as from the Diana.

*Enterprise*, Sept. 13th: Mr. J. W. Bowers late in from Nye county, brings the following news: The Pioneer mill, erected in the latter place some two years ago, has been lying idle for several months past. Mr. Cormack, one of the lucky discoverers of the Silver Peak Dist., has recently made arrangements to run the mill, and is now busy placing the mill in condition for business. Large quantities of ore being ready for crushing and the mill in successful operation. Mr. Carmichael, who recently arrived there, representing a company in New York with a large working capital, has commenced operations on the company's mine.

Silver Bend *Reporter*, Sept. 4th: The following is the amount of ore shipped from the Fisherman ledge, during the last quarter: 1½ tons at the Faulkner mill, producing \$412 per ton; 4½ tons—another lot—at same mill, per ton, \$280; 5½ tons at Parrott mill, \$390 per ton; 1½ tons at the Manhattan mill yielded \$700 per ton.

At Reveille there are now some eight or ten companies at work taking out ore for shipment to the new mill. The Bullion Co. has out 10 tons of first class ore from the Fisherman ledge which will be worked at this mill, having already contracted for its delivery from the mine to the mill at \$30 per ton. The value of the ore is placed at \$450 per ton. Eighty-five tons of second class ore is also piled up at the dump which is estimated will yield an average of \$150 per ton. Upon the Fisherman a depth has been reached of 75 ft., about 60 ft. perpendicular. This incline has reached the limit of the limestone crust and penetrated a black slate, which shows strong indications of water, and in which the vein occurs regular and unbroken. Should there be no mistake about this, and the lime rock indeed prove but a thin crust, while the veins of rich ore continue in the underlying rock, many claim owners there who have hitherto become discouraged in their explorations in this crust upon what appeared to be only lumps of mineral, will again take hold with new heart and continue the work of development. From the Desert Queen finer ore is now taken than ever before—valued at about \$800 per ton. The Pearl—worked by H. Martiu Smith—has produced a number of tons of rich ore which will be worked in an arrastra, now building for the purpose.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

*Enterprise*, Sept. 14th: The Chollar-Potosi Co. are now daily taking out 400 tons of ore per day, supplying 12 mills.

A fine new boiler, 54 in. in diameter, and 16 ft. long, with 36 4-in. tubes, is being manufactured at the Nevada Boiler Works for the Empire State mill.

The total shipment of bullion from this city and Gold Hill for the past week was but 5,767 lbs., worth \$131,863.47.

*Trespass*, Sept. 11th: The Sapphire mill in Gold Hill stopped crushing ore on the 1st inst., for the purpose of giving the machinery a thorough overhauling. It will start up the first of next week on Chollar-Potosi ore.

Gold Hill *News*, Sept. 13th: The great hoisting horse of the Empire Imperial Co. is being closed in rapidly. The immense sign is being lettered in brilliant colors. The cupola is finished. The ponderous machinery will be leveled on the grand granite foundations next week.

The Nevada Boiler works, in Lower Silver City, are turning out a mammoth boiler and a steam drum for the Empire State mill. The boiler will be 54 in. in diameter, and 16 ft. long. It will 36 4-in. tubes, with 1½ in. in space between the tubes—a greater space than ever allowed in a boiler of this description. The heads will be seven-sixteenths of an inch thick. The steam drum will be 36 in. in diameter, and seven feet long.

#### OREGON.

Jacksonville *Sentinel*, Sept. 7th: D. C. Cohn has arrived from San Francisco, and is going to start the Enterprise quartz mill, and push work forward with renewed energy. He intends to work the rock by a new process, and thinks he can make it pay \$250 to the ton.

Beach, Anderson & Co. are running a tunnel through the ridge between Althouse and the valley. The lower part of the creek is known to be rich in auriferous gravel.

Prospectors in the neighborhood of Diamond Peak, in the Cascade Mountains, have discovered several quartz ledges in what seems to be a parallel range, at least they found three leads near together, and running parallel to each other. The rock is rich, with some kind of metal, and it is thought to be silver, as it stands all the tests to which the prospectors were able to submit it. The specimen which we have, shows metal, though what it is we cannot say.

Idaho *World*, Aug. 28th: Some very rich gold quartz has been recently found in the mountains near Blue river, Oregon, 50 miles from Eugene City. The yield of the specimen brought in, by hand mortar process, was at the rate of \$2,260 per ton. The discovery causes great excitement in that section.

Sept. 14th: Col. Butterfield is sinking shafts in the cement beds, about a half a mile this side of Waldo. The Colonel's intention is to go down until he strikes the bedrock, hoping that he will find a layer of pay gravel between the cement bed and the bedrock. Some years since, Mr. Samuel Scott sunk through the cement, lower down on the flat, and got good pay; but whether like results will be realized in the gulch, remains to be demonstrated.

Salem *Herald*, Sept. 6th: The Ruckle quartz mill on Powder river, running on the Rockfellow ledge ore, has lately yielded \$7,000 at a clean up, after working 110 tons of ore.

#### UTAH.

Salt Lake *Vedette*, Sept. 7th: Reports are in circulation about town, brought in by parties who have recently arrived from the mines, which state that the prospects of that place are good. No placer diggings have, as yet, been struck, and no prospecting done outside of the quartz ledges. The weather was good, the miners in good spirits, but not a great many in there yet. Several were met en route well provided with tools, provisions and arms from Idaho and Montana, who design to do some prospecting on the Wind River side of the ridge.

**DRAWBRIDGE ACCIDENTS.**—The carelessness of those in charge of railway drawbridges has caused the loss of many lives. The following is a brief description of an invention about to be tried on the New York and New Haven railroad, which, it is believed, will effectually prevent the ill consequences of such carelessness in future:

It consists of a signal attachment to the bridges, so arranged that no draw can be opened without turning a crank at each end, which crank moves a rod connecting with a signal board placed about two thousand feet from the bridge. By means of the rod, this board is dropped across the track; so that in case the engineer should neglect to observe the signal, he would be sure to hear his engine strike the signal-board. He would then have plenty of time to stop before reaching the bridge. At night a lamp is placed on the signal-board. When the bridge is all right, the board is drawn into a covering out of sight.

THE Emperor Napoleon has ordered the purchase of three of McCormick's reapers for his private farms.

Witnesses should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. G. Knox is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1867.

Dr. J. G. Yates is our duly authorized travelling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized travelling agent for this paper. July 15, 1867.

Mr. W. T. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

Mr. H. C. Northrop is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Sept. 21 1867.

## Notices to Correspondents.

TALPA, Cisco.—Tungsten, respecting the properties of which metal you are at present inquiring, has already engaged the attention of no inconsiderable number of persons, who, like yourself, feel a deep interest in obtaining, if possible, some indurated substance which will be capable, practically, of supplanting so expensive a mineral as the diamond, as a material for drilling purposes. Tungsten has hitherto only been obtained in a separate form in small grains, in which state it is barely fusible, in a blast furnace, requiring a higher temperature than manganese. It is not magnetic, has a high specific gravity, or about 17.50; is of a steel-gray color, with a strong metallic luster, if reduced by means of carbon. When procured by passing hydrogen over ignited tungstic acid, the metal so obtained is tin white. It is most probable that the real utility of tungsten will be found rather as an alloy, or one of a complex alloy of steel, tungsten, titanium, and possibly manganese. Tungsten is a tolerably abundant material in the tin districts of Cornwall, where it is generally known under the name of wolfram. Indications exist, from the appearance of specimens, that it may be found in the Sierra Nevada, to some extent, as tungstate of lime, and may, for the purpose above indicated, become of considerable economic value.

MEDICUS, Sierra Co.—Lithium is the metallic base of the various compounds employed in medicine known as lithia and carbonate of lithia. It is obtained from the mineral kingdom only, hence its derivation from the Greek word signifying "a stone." The following are the chief minerals from which it is procured: Petalite, containing on an average about 5 per cent. oxidolithium; lithia-spodumene, 8 per cent.; ambligonite, 11 per cent.; Triphylite, 3.4 per cent.; lepedolite, 3-6 per cent. Lithianite, apyrite, and the tourmaline of Utah also contain it. Some of the micaceous varieties are sufficiently rich to remunerate the searcher for extracting the lithia therefrom. At present the supply is chiefly obtained from the Austrian dominions. It is found to be a most valuable remedy for such as are afflicted with gouty and rheumatic affections. It could, perhaps, be found in California.

S. V.—Cannon, as a word applied to ordnance or artillery, is originally derived from the Latin *canna*, a pipe or large tube, in consequence of the celebrated Greek fire having been, whilst employed in warfare, projected from tubes or pipes open at each end, which protruded from the vessels or galleys which used them. The word *cane* has a similar derivation, which, strictly speaking, ought to be confined to such varieties of the graminaceae as possess hollow stems only, not such as are aroid.

X. Z.—The binoxide of tin (tin, stone or ore) has been crystallized by Daubrée. The crystals so obtained were colorless, possessing the luster of the diamond, would scratch glass, and had a specific gravity of 6.72.

## Perpetual Motion.

As an apology for the above heading, and for the following remarks upon this exploded error, we would state that we have just seen a paragraph in a Nevada City paper, to the effect that a gentleman of that place has recently left for Washington to secure a patent for "a new mechanical power, or a new application of motion and power, which is destined to revolutionize the motion now used in machinery." The gentleman's experiments had been carried on for five or six years with the utmost secrecy. A few of his friends were allowed to see the model of his invention before he left. The expressious reported as having been made use of by them, imply that they consider him to have succeeded in discovering the long-sought impossibility—"perpetual motion."

Nothing is more definitively settled among scientific men than the utter absurdity of the notion that a machine is possible which, constantly renewing its own power, would forever continue in motion without aid from any external force. But there has always existed, and always will exist, a class of enthusiastic untrained minds, which cling to the delusion with the earnestness which characterized the old searchers after the "elixir of life,"—which should insure to its fortunate possessors perpetual youth.

It was not, perhaps, so strange that the notion prevailed as long as the doctrine of the *annihilability of force* obtained. If, for example, in the case of a blow struck with a hammer upon an unyielding anvil, it could be said that its power was *destroyed*, or *annihilated*—that is, that its *effect* was *nothing*—it could be urged that *power* also was possible without a *cause*—that is, from *nothing*. But this was actually the doctrine maintained. Philosophers could only say that resisted force was *destroyed*. This was the condition of science, even after the great stride had been made, by which the *indestructibility of matter* had been demonstrated. Before that time, when a chemist failed to account for a portion, by weight, of the substance under analysis, he could only say it was *destroyed*. Under such a cloud, progress was necessarily slow. But the point once established that matter was not to be annihilated, he worked upon a different basis; for he knew that the missing matter must be charged to his own imperfect work. An amazing advance in chemical science was the result.

Just what Lavoisier did for chemistry, Mayer and Joule have done for mechanics; and not for mechanics only, but for all physical science. They have demonstrated the *indestructibility of force*. They have shown that force, like matter, can neither be *annihilated*, nor *created*; but is simply changed in its form or mode of exhibition.

The doctrine thus established, that of "Conservation of Force,"—or, as it has been also termed, the "Persistence of Force,"—opens up, not only to the physicist, but, we may say, to the psychologist, a most magnificent field; a field inconceivable in its vastness. It has been declared "the most far-reaching principle that adventuring reason has discovered in the universe." Faraday speaks of it as "the highest law in physical science which our faculties permit us to perceive." Mr. Herbert Spencer says it is "the fundamental truth of all philosophy," and goes on to observe that it extends beyond the bounds of experimental science; that it is "deeper than demonstration"—deep as the very nature of mind.

To the thinker who properly regards the subject, these expressions will not appear extravagant. Let him consider, for instance, the case adduced—of the blow of the hammer upon the anvil. What is the effect produced? *Heat is generated*. The amount of this heat is susceptible of calculation. By experiments it has been proved that if the hammer weighs ten pounds, and

*falls by its own weight only*, from a height of one foot, thirteen thousand five hundred times, sufficient heat is produced to melt a pound of ice, *and boil it*. How much greater the effect, then, if the muscular strength of the man who wields the hammer is so exercised as to give it many times the force derived from the *fall only*! Resisted force, then, is not wasted—is not annihilated; for the heat produced can be again converted into precisely the same amount of force. The water thus made to boil, and converted into steam, will lift the hammer to the same height, and exactly as many times, as would be necessary to produce the first effect. This has been proved by experiment.

But whence comes the force exerted by the man? From the *food*, which has furnished the material for his muscle, and also for the combustible matter, which, like the fuel with which we feed our fires, combines with the oxygen of the atmosphere, producing that heat, which, whether in the fire or in the man, is merely converted power, and which can again, in its turn, be reconverted into power. But whence comes that food? From the vegetable kingdom; for, though a portion of his diet may be animal, that is itself nourished solely by plants. But whence do plants derive their life? Their substance is earthy; but their breath of life is the sun's heat and light.

This brief summing-up will be enough for the reasoner. *The sun, then, is, physically speaking, the sole source of force upon our earth*. Can anything be grander than this generalization? The steam engine derives its force from the same source, either from the combustion of wood, the vegetable growth of the present age, or from that of coal—the vegetable growth of a former age—the stored-up result of what was equally the sun's action upon the materials brought under its influence. It is not necessary for us to go farther back. We have nothing to do here with the question of the source of the *sun's* power. Whether it is an eternal, individual, personal Omnipotence, is not a question for us to discuss in this place. To all intents and purposes, our sun is for us *infinite*—both in its duration, and its power to send forth its life-giving rays eternally, without diminution of substance. Neither have we anything to say of an hypothetical "Vital Principle," or *innate energy* in man; for whatever that may be, it is certain that for the kind of force with which we have at present to do, it is "nil," without the food for the body which keeps up the chemical action aforesaid. The doctrine once held, that this force—this "*vis viva*"—existed in the *germ*, a microscopic particle too minute to be appreciated, is now considered absurd. In that case the germ of the first ancestor would really contain the force of a hundred generations. The truth is, the force comes *from without*; the germ merely determines the form in which the force shall exhibit itself.

Heat, light, electricity, magnetism and gravitation, are but forms or modes of the same thing—of motion or force. Each is convertible into the others. The total amount of force in the universe is always the same, as is the total quantity of *matter* the same. It follows, of course, that *no force can be originated*, and that all force must be derived from the conversion of some of these other forms of motion into it. The same amount of force exerted by a clock-weight which reaches the floor after eight days' constant action, is exerted in another form, by the hand which winds up that weight in a few seconds. The clock-work merely directs the *manner* in which that force shall expend itself; it answers to the *germ* in that respect—it is not the force itself. So of any other machine. It *originates* nothing. A perpetual motion machine is, therefore, in the nature of the case, a chimera. A man may perhaps enlist in his service for a time, and by that means obtain motion through properly arranged mechanism; but can he so store up those rays

that they will furnish a supply of force to be drawn upon during their daily absence? When that has been done, and in such a way as to require no outside interference until the apparatus falls to pieces from actual wear, we may perhaps modify our assertion.

PHOTO-CHEMISTRY.—M. Carey Lea, in his "Contributions toward a theory of Photo-Chemistry," coins the word *actinescence* to express a property which the *chemical* rays of light possess, analogous to that belonging to the luminous rays or phosphorescence. He says that perfectly pure iodide of silver, if exposed to light, undergoes no chemical change. Nevertheless it changes slightly in color, and has, moreover, acquired a new property, viz., that of attracting a metallic vapor; is, in fact, prepared for a chemical change, which, however, cannot occur *until some substance which is capable of combining with iodine*, is brought in contact with it. A film of this pure iodide, may be exposed for hours to a bright sun without undergoing any further change than the slight darkening in color which a single second will equally produce. If, moreover, it be afterwards laid away in the dark for a time, it recovers completely its sensitiveness, and after being again exposed to light for a single second—to prepare it as before—it is as ready for the reception of an image as ever. The change which *does* take place, indicated by the slight change in color, is a *physical*, not a *chemical* one. The particles of the surface of iodide of silver—a compound substance—are made to vibrate, to a *certain extent and no more*, by the chemical or actinic rays of light. This vibration is analogous to that of the particles of a thin glass surface, if a certain musical note is sounded in its immediate neighborhood. If this note is sounded with too great force, the vibration is excessive, and the glass, as we know, is shattered. The violence of motion is greater than it can bear; and it is disintegrated. Similarly, or rather we should say, analogously, if a surface of pure chloride of silver be exposed to these actinic rays, the motion of its particles is excessive, and chemical decomposition takes place. But not so with the *iodide*. If *pure*, it will not yield to such agency; *it is not decomposable by light alone*. This fact, together with the fact that *it is sensitive to light*, is the corner stone of photo-chemistry.

Phosphorescence is the gradual radiation of stored light. If a body is heated, it parts with its heat by radiation in a comparatively brief space of time. Yet the analogy is evident, and in *actinescence* we have a hint at the explanation of phosphorescence. In Mr. Lea's words, "*The 'physical' impression of light is a persistence of the invisible (or 'chemical') rays, exactly parallel to the persistence of the visible or luminous rays, in phosphorescence.*" The effect passes off after a time—*radiation* is complete—and the "photo-equilibrium" is gradually restored. Twenty-four hours is usually sufficient to restore this equilibrium in the case of the iodide of silver. During this time, its particles are vibrating at a certain rate. Although no decomposition takes place, it is, during this twenty-four hours of actinescence, *open to decomposition* by contact with any substance capable of combining with iodine; after this time, it requires another exposure to light, to again prepare it for such decomposition.

A GOOD YIELD.—We have learned from Messrs. Hall & Harnden, No. 409½ California street, that the eighty tons of Green Emigrant ore, mentioned in the Mining Summary under the head of Excelsior, yielded a net profit of \$2,052, and the sulphurets assayed \$3,800 per ton, gold, .904½ fine. The eighty tons of ore contained six tons of sulphurets.

OIL.—During the past six years, 7,920 wells have been sunk in the United States, and eleven and a half millions of barrels of crude oil produced.

Editorial Correspondence.

P. M. S. S. SACRAMENTO, }  
August 31st, 1867. }

This is an easy-going steamship, and, after passing through a brief but severe test, has been declared by those aboard to be the best behaved steamer of the line. We left San Francisco August 19th, and will be at Panama to-morrow, on the thirteenth day out. The ship is now running at low speed, that we may not arrive ahead of schedule time and before the railroad is ready for our transit.

Our passenger list is small, the steamer large, and our accommodations commodious. We have had, for the most part, a smooth and delightful trip. Any one who has not lately traveled on this line, who now takes first-class passage, will hail with favor the noticeable improvements which have taken place in both ships and regulations. The delight to "speak of men as we find them," prompts a special mention of our officers. Capt. J. M. Cavarly, comparatively a new officer on the route, is an "old salt." His qualities as a commander are exemplary. He admirably enforces strict discipline throughout the entire ship, and has the perfect confidence and good will of his passengers. Capt. Cavarly is well supported by his assistants—D. C. Wood, First Officer; John Graham, Chief Engineer; Fayette M. Ringgold, Surgeon; R. M. Bevell, Purser, and Thomas Harris, Steward. Strict in his duties, we found the Purser equally apt in his courtesies. Mr. Harris fills his position amply, as well as the mouths of the passengers. In fact, so universally satisfactory are the officers and ship, that the passengers have united in addressing the following letter to Captain Cavarly, which we are permitted to copy in this communication:

ON BOARD STEAMSHIP SACRAMENTO, }  
August 30th, 1867. }

To CAPT. J. M. CAVARLY:

Dear Sir: The undersigned passengers, about completing a very pleasant voyage on the ship under your command, desire to express to yourself and the officers associated with you, their appreciation of the thorough discipline observed on board your ship, of the uniform courtesy extended to them, and of the excellent attention paid to the safety, comfort and convenience of the passengers.

We can heartily congratulate all travelers who may hereafter be entrusted to your care, in having the satisfaction of sailing with one who so fully unites the qualities of the gentleman and mariner.

Wishing you and all your officers health and prosperity, we are,  
Truly, your friends,

In behalf of the passengers.

The above furnishes the names of several gentlemen connected with prominent mining interests on the Pacific coast, of which we shall make future mention. D.

PERSONAL.—During the past week we received a visit from his Excellency Geo. L. Woods, present Governor of the State of Oregon. The Governor is in rather feeble health, owing to his arduous labors during the late political campaign. He returned to Oregon on the steamer of the 18th inst. The Governor has established a reputation as an eloquent and popular speaker, and we suppose he will be content to rest on the assurance that his labors were appreciated, although not crowned with success. We hope that his health will resume its usual tone in the dewy land of Webfoot.

TOLL-GATES are unknown in Switzerland. Travel is thereby encouraged. The Government pays one-half the cost of keeping the roads in order.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

67,842.—AMALGAMATING PRECIOUS METALS. John B. Beers, San Francisco, Cal.

I claim the use of amalgamated woven wire gauze or amalgamated perforated sheet metal.

I also claim, in combination with amalgamated wire gauze or perforated sheet metal, the canvas or cloth arranged under the wire gauze or perforated metal.

I also claim, in combination with the amalgamated wire gauze or perforated metal, the use of corrugated amalgamated sheet metal plates, either with or without the canvas or cloth.

I also claim, in combination with amalgamated plates, the use of wire gauze or screens, arranged on or above the plates, substantially as described for the purpose set forth.

This amalgamator will so constructed that the particles of gold will be prevented from being carried away before the mercury has taken it up and amalgamated it, and consists in the employment of a wire-gauze screen, wire cloth, raised or corrugated copper plates, either amalgamated with mercury or otherwise. Any of these devices may be used for sluices in placer, cement, and quartz mining, and will be efficient in rifle-boxes, shaking-tables, long-toms, rockers, concentrators, the batteries of quartz and auriferous cement mills, and the covering of the aprons or platforms in front of the batteries, either as a substitute for the copper amalgamating plates now used, or in connection with them.

67,858.—CLOTHES-WASHER.—F. Erust, San Francisco, Cal.

I claim placing the fabrics to be washed between perforated plates or sieves, C and D, in a closed vessel of any suitable construction, so that a vacuum, F, may be created beneath the lower plate, substantially as described.

67,935.—STEAM GENERATOR.—Charles O. Winegar, Drytown, Cal.

I claim connecting each series of tubes to separate and independent chests at both ends, so that each series of tubes can expand and contract without straining the others or being strained themselves.

I also claim arranging the tubes in each tier so as to form a connection between all the tubes used, substantially as described.

THE ALASKA SURVEYING PARTY HEARD FROM.—The *Alta* of the 18th, says that a private dispatch dated Sitka, August 20th, via Victoria, has been received from Prof. George Davidson, who has charge of the scientific party on board the revenue cutter Lincoln, about to make surveys on the coast of our new northern possessions. The dispatch says that the party had had continual rain, fog and southeast storms during the whole of the month of August, and work was rather discouraging. They expected to start for Unalaska, one of the Aleutian islands, on the 23d of August, and hoped to get some lines of soundings over the fishing banks, and would then return to Sitka to make some special examinations, and thence work to the southward. The expedition had been well received by the Russians, and the Governor, Prince Maksontoff, had afforded them all the information in his power.

HAYES-HIGGINS COLLECTION.—The amount realized in cash by this performance, was \$3,600, after paying \$100 for band, carriages, etc. This sum has been equally divided, as was intended, between the two Orphan Asylums. The managers of both institutions have duly acknowledged the receipt of the same by letters to the committee, which letters have appeared in the city journals.

FLIGHT OF BIRDS.—A hawk can fly 150 miles an hour; an eider-duck, 90 miles; a crow, 25 miles. A falcon, belonging to Henry IV. of France, flew from Fontainebleau to Malta in less than 24 hours, the distance being 1,350 miles; and it is probable that his flight was about 95 miles an hour, as such birds fly in the day-time only.

NORTH AMERICA  
Life Insurance Company.

Usual Restrictions on Occupation and Travel  
ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!

J. A. EATON & CO.,  
Managers Pacific Branch, 302 Montgomery st.  
2d flr 29 SAN FRANCISCO.

JACOB SHAW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street) takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection. 10v141f

SECRETARSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v151f

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of fitting the fangs of dead Teeth, and building up broken crowns with *POUR* GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v141f

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v143m

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v141v AUSTIN A. WELLS, Agent.

PICKERING'S  
ENGINE REGULATOR,

Warranted the Best in Existence.

Cheap and easy to attach to any Engine, old or new. Send for a Circular, to DAVID STONDAAT, 114 Beale street, San Francisco. 12v15-2an1q

WESTERN HOTEL,

Nos. 43 and 45 K street, between Second and Third streets, SACRAMENTO.

Board, per week.....\$4  
Meals.....25 Cents.  
12v15qr N. D. THAYER, Proprietor.

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE  
CALIFORNIA SAVING BANK, California  
street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 10v1419pqr

BUSINESS NOTICE.—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

FOR OMBRET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v15qr B. F. HOWLAND, Artist.

Perry Davis' Vegetable Pain Killer.

We clip the following from the Providence (Mass.) General Advertiser:

"At this season of the year, when cholera, cholera morbus, dysentery, and other kindred complaints are sure to prevail, everybody should be liberally supplied with Perry Davis' Vegetable Pain Killer. Persons leaving home, whether it be for a day's excursion or a trip to Europe, should be in a condition to place their hands upon it at a moment's warning. Many diseases incident to the summer months, which will prove fatal if not immediately checked, can be promptly cured by one or two doses of the Pain Killer. On more than one occasion have we been relieved of intense suffering by the timely use of the above named preparation.

Sold by all Druggists, Grocers and Medicine Dealers everywhere. 10v151m

ROOT'S

Patent Force Blast Blower.

Adapted for Smelting, Foundry, Mining and Steamships.

Requires 50 per cent. less power than any blower now in use. For further particulars, address KEEF, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15119p

Oakland College School.

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address,

I. H. BRAYTON, Principal.  
OAKLAND, California. 5v15qr9p.

LINSEED OIL.

The Pacific Linseed Oil & Lead Works

Are now prepared to furnish dealers and consumers Pure Linseed Oil,

Raw or Botted, at the Lowest Market Rates. We call special attention to the quality of our Oil, believing it to be superior to any imported Oil offered in this market. Also Oil Cake Meal, the best article known for fattening stock and increasing the product of milk.

Cash paid for Castor Seeds and Linseed, on delivery at the factory. Address,

Pacific Linseed Oil and Lead Works,  
Care of L. S. BENCHLEY & CO.,  
13v143m9p San Francisco.

PACIFIC

Rolling Mill and Forge Co.,  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON  
—AND—  
Every Variety of Shafting

Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Connecting Rods, Cur and Locomotive Axles and Frames.

HAMMERED IRON

Of every description and size.  
Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.  
The highest price paid for Scrap Iron. 9v15m9p

DR. FONDA'S  
San Francisco Eye Infirmary.

Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years Principal of the Lafayette (Ind.) Eye Infirmary. P. W. FONDA, M. D., Surgeon in Charge. Office, 402 Montgomery street, opposite Well, Fargo & Co's. 4v15139p

AGENTS WANTED.

ENERGETIC MEN OR WOMEN CAN MAKE MONEY in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v15qr9p 505 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, etc.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Printer's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Oaring, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries or machines with the latest improvements, every variety of Stamps, Mortars, Camps, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Machinists and Foundries. PALMER, KNOX & CO., Golden State Iron Works, Nos. 19, 21, 23 and 25 First Street, SAN FRANCISCO.

MANUFACTURE ALL KINDS OF MACHINERY. STEAM ENGINES AND QUARTZ MILLS DUNBAR'S IMPROVED Self-Adjusting Piston Packing. Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S NEW GRINDER AND AMALGAMATOR HEPBURN & PETERSON'S AMALGAMATOR AND SEPARATOR, Knox's Amalgamators, WITH PALMER'S PATENT STEAM CHEST.

WILLAMETTE IRON WORKS, PORTLAND, OREGON. Steam Engines, Boilers, SAW AND CRIST MILLS, MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

UNION IRON WORKS, Sacramento. WILLIAMS, ROOT & NEILSON, MANUFACTURERS OF CROSS' PATENT BOILER FEEDER, STEAM ENGINES, BOILERS, And all kinds of Mining Machinery.

Dunbar's Patent Self-Adjusting Steam Piston PACKING, for new and old Cylinders, manufactured to order. Front Street, between N and O streets, 16v11 SACRAMENTO CITY

Pacific File, Reaper and Mower Section MANUFACTORY, No. 63 Ecite Street, between Market and Mission, SAN FRANCISCO. Files re-cut and warranted as good as new, or no charge. The only establishment in the State. We also manufacture Reaper and Mower Sections.

GLOBE Foundry and Machine Shop, STOCKTON, CAL. KEEP, BLAKE & CO., MANUFACTURERS OF Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, Mining and Irrigating Pumps, Car Wheels, Derrick Irons, House Fronts, Iron Fencing, Balcony Railings, etc., at San Francisco prices. Orders solicited and promptly executed.

GEORGE T. PRACY, MACHINE WORKS, Nos 109 and 111 Mission street, between Main and Spear, SAN FRANCISCO. STEAM ENGINE, FLOUR AND SAW MILL And Quartz Machinery, Printing Presses, AND MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED. Special attention paid to Repairing.

SAN FRANCISCO Foundry and Machine Works, N. E. Cor. Fremont and Mission streets, Manufacturers of Marine and Stationary Engines Quartz Machinery, Saw, Flour and Sugar Mills, Mining Pumps, Hoisting Gear, Agricultural Implements, etc. ALSO—Wine, Cider, Cotton and Tobacco Presses of the latest Improved Patterns.

STEAM ENGINES AND BOILERS, Of all sizes, constantly on hand: Quartz Mill Shoes and Dies warranted to be made of the best white iron. Dunbar's Improved Self-Adjusting Piston Packing, requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky. MACHINERY OF ALL DESCRIPTIONS Bought, sold, or exchanged. Bolt Cutting and Castings at the lowest market rates. DEVOE, BINSMOKE & CO

LEWIS COFFEY, J. S. RISDON, LEWIS COFFEY & RISDON, Steam Boiler & Sheet Iron Works. THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

CALIFORNIA BRASS FOUNDRY, No. 125 First street, opposite Minnan, SAN FRANCISCO. ALL KINDS of Brass, Composition, Zinc, and Babbit Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Goggles and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE. V. KINGWELL. 19v13-1y J. H. WEED.

HANSCOM & CO., T. FENDERBAST, H. S. SMITH, W. W. HANSCOM. Etna Iron Works! Southeast corner Fremont and Tehama streets, SAN FRANCISCO. Practical Machinists and Iron Founders, MANUFACTURE STEAM ENGINES, QUARTZ MILL MACHINERY OF ALL KINDS, SAW MILLS, FLOUR MILLS, Dunbar's Improved Self-Adjusting PISTON PACKING, Now so extensively used in the East and in this State. Requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.

HANSCOM'S CRUSHER, The best of the kind now in use in this State or anywhere else; Wheeler & Randall's New Grinder and Amalgamator, Which only needs examination to be appreciated. Tyler's Improved Water Wheel, Oiving greater power at lower cost than any wheel in use. Send for one of our circulars, giving full tables. All wheels warranted to give the power as set forth, or the money will be refunded. Sole makers for this coast of the "Pendergast White Iron Stamp Shoe, and Dies. None genuine unless obtained from us. Every one warranted. Patented Machinery of all kinds will be furnished by us at market prices. Particular attention given to drawings and specifications of machinery, which will be made to order. The patronage of the public is respectfully solicited. 19v12

FULTON Foundry and Iron Works. HINCKLEY & CO., MANUFACTURERS OF

STEAM ENGINES, Quartz, Flour and Saw Mills, Moore's Grinder and Amalgamator, Brodie's Improved Crusher, Mining Pumps, Amalgamators, and all kinds of Machinery. N. E. corner of Tehama and Fremont streets, above Howard street, San Francisco. 3-ay

NEPTUNE IRON WORKS, Corner of Mission and Fremont Streets, SAN FRANCISCO. MARINE Locomotive, And all kinds of HIGH PRESSURE Steam Boilers

All Boilers guaranteed and tested by U. S. Boiler Inspector before sent out of the Shop, at Shop expense. All kinds of Sheet Iron and Water Pipe, Coal Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order. Old Boilers Repaired D. CAMEKON. 6v12-1y

AMERICAN RAILWAY CARS IN ENGLAND.—As soon as the contemplated shortening of the distance between London and Liverpool by ten miles is completed, the two hundred miles will be made in 4¼ hours. There will be no stoppages. The cars will be made on the American plan, with a passage from one end of the train to the other; and there will be refreshment rooms. An artesian well on the route will furnish water for the engine, which will take it up from a trough between the rails, without diminishing speed.

WOOD PAPER PATENT.—An application for the renewal of this patent, which expired in August, has been made. Printers and publishers oppose it, on the ground that it will keep up the price of paper. They insist that Watt & Burgess, the parties holding the patent, have had a fair profit from it.

TOWNE & BACON, Book and Job Printers, Have the Largest Office, Do the most work, And do it better Than other offices In this City, 536 Try them With a Job, And you will be Satisfied the above Statements are facts. Their office is at 536 Clay St., below Montgom'y, Over Pacific Fruit Market.

BAURHYTE & McAFEE, Steam Boiler and Sheet Iron Works. Owned and conducted by Practical Boiler Makers. High and Low-Pressure Boilers, Stationary and Marine. Howard street, bet. Fremont and Beale, San Francisco.

I. H. SMALL, MACHINE SHOP, BUILDER OF Steam Engines, Sawmills, Mining Machinery, and Wood Planers. Repairing of all kinds done with promptness and dispatch. Gears of all kinds cut at short notice, corner of Market and Beale st. San Francisco. 6v15-3m

CALIFORNIA TOOL AND FILE FACTORY. Blacksmith and Machine Shop. No. 17 Fremont street, between Market and Mission, S. F. 4v15-3y J. WEICHHART, Proprietor.

LINCOLN IRON WORKS, No. 51 Beale st., bet. Market and Mission. D. & W. FOURNESS, Prop'rs.

STEAM ENGINES, Flour and Saw mills, and MACHINERY of all descriptions, made and repaired at shortest notice. Particular attention paid to repairing Reynold's Cut-off. 5v15qr

J. NEWSHAM, J. SIGWOOD. SOUTH BEACH IRON WORKS, Near corner of King and Third streets, San Francisco. MARINE ENGINES, AND ALL KINDS OF

MACHINERY FORGING. All kinds of Ship-smithing and Mill work manufactured to order—Jobbing of every description promptly attended to. All work done guaranteed. 13v14-1y

JOHN LOCHHEAD'S Steam Engine Works, Beale street, near Mission, San Francisco.

STEAM ENGINES OF EVERY DESCRIPTION BUILT to order—Marine, Stationary, or Locomotive. HOISTING AND PUMPING ENGINES, PORTABLE ENGINES, OF ALL SIZES, DONKEY PUMPS, Etc., Etc., Etc. The attention of the parties engaged in shipping or inland navigation is called to the Superior Workmanship of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES. Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**THE DARWINIAN THEORY.**—Dr. Bischoff, Professor of Anatomy and Physiology in Munich, has published a work in which the anatomy of the gorilla, chimpanzee, etc., is compared with that of man. In a note upon the Darwinian Theory, some of the points brought forward are thus stated in the *American Journal of Science*: The assertion that man is directly descended from the ape, is contrary to the Darwinian theory itself, if rightly understood; for the extinction of the parent form is the direct consequence of the development of an improved form. The great problem of organic nature is twofold: 1. The origin of the simplest original forms; 2. The causes and mode of their operation, by which more perfect forms were developed. A great defect of Darwin's theory is that he leaves the first question unanswered. Admitting that certain organisms must have been created, what right has he to say that other organisms may not have been created at intervals, even to the present time? Another defect of the Darwinian theory is, that no cause is assigned for the commencement of variation. To say that organisms have at once the power of transmitting peculiarities by inheritance, and of spontaneously originating variations, is a contradiction in terms. Darwin's treatment of the second half of the second question is more successful. Natural selection and the struggle for life must henceforth be fundamental principles in any theory of development. Since no general cause is assigned either for the origin of life or the commencement of variation, all that can be considered as proved is that certain forms have been produced by variation from certain other forms. The facts warrant no general induction. We must be very cautious in accepting plausible theories without sufficient proof. The vagaries of the "naturphilosophie" furnish an instructive example. The physical difference between man and brute is not merely quantitative, but qualitative. The distinctive peculiarity of man may be designated as *self-consciousness* (selbstbewusstsein), or the faculty of making one's self and one's mental condition a distinct subject of thought. On this faculty depend other important peculiarities of man, viz., the capability of indefinite progress, the idea of morality, the notion of a future state, and the power of language.

**TRANSPLANTING TREES.**—In taking up a tree, it should be so marked as to secure its setting out in the same position. Thus the north side may be marked with chalk, before work is commenced. If the side which has been exposed to the north is turned toward the south, the heat of the sun is too great, and it dries up and loses its vitality.

**BLASTING POWDER.**

PRICE, \$3.00 PER KEG.

**Piles! Piles! Piles!**

NOT PILES OF GOLD, NOR YET OF SILVER, so much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

**WOOD'S SUB-POSITORY.**

It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. The SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it if you are troubled with the Piles—you will not be deceived in it.

Sold wholesale and retail by J. H. REDINGTON & CO., Nos. 416 and 418 Front street; GEO. GAINSWOLD, corner of Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Bush street, between Montgomery and Kearny. O. WOOD, Proprietor, No. 63 Tehama street, between First and Second. 21v14-3m

**THE PACIFIC IRON WORKS,**

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryon Battery, Varney's Amalgamators and Separators, Eversman's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

**FIRST Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**

It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc., successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

NEW CLOTH ROOFS put on; copings and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—or eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis's building, 83 West Front, on Folsom street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums dissolved in linseed oil, mixed with the various coloring matters and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fish-bussets at Cape Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used. Geo. No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v16

**Dr. Hufeland's Swiss Stomach Bitters.**

THE WORLD RENOWNED REPUTATION TOGETHER with the extensive and increasing demand for Dr. Hufeland's Swiss Stomach Bitters, will at once recommend them to the favorable notice of all connoisseurs and lovers of a good and healthful tonic and invigorator. As a purifier of the blood, acting surely, yet gently, on the secretions of liver and kidneys, they are unsurpassed and a most agreeable drink.

For sale at all wholesale and retail stores on the Pacific Coast, and at the depot of TAYLOR & BENDEL, 413 and 415 Clay street, between Sansome and Battery, San Francisco. 20v14-6m

**Just Published.**

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON PHYSIOLOGICAL AND MEDICAL ASPECTS OF THE Nervous System and Reproductive Organs, to be had by addressing and inclosing twenty-five cents, postage stamps to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 12v13-1v

DR. H. AUSTIN, DENTIST, No. 634 Washington Street, Between Montgomery and Kearny Streets [OVER SAN FRANCISCO BATHS] SAN FRANCISCO. 20v10-qr

J. W. WINTER, DENTIST, Office, 647 Clay street, San Francisco. First class root fillings for \$3, as good as any dentist can produce in the city. Dr. Winter has practiced Dentistry twenty years—since in this State. For a full upper set of gum teeth, on vulcanite base, from \$20 to \$35. Teeth extracted without pain by local application. 18v14f

RADICAL CURE —OF— RUPTURE! Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process, 624 Washington street, up stairs, Washington Baths Building, between Montgomery and Kearny streets.

DR. A. FOLLEAU Has his studies and manufactures in the same building. Every kind of Apparatus, Trusses, orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself. He has no connection with any Agency. 21v14-1p1f

MOSHEIMER'S PIONEER MINING SCHOOL —AND— Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches: 1. Assaying of ores, metals and other mineral substances. 2. Technology, or Chemistry, as applied to any special branch of manufactures. 3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5. Concentration. Dressing of ores. 6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology. Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore, learn first, if you have a mine, then study the nature of the ore, and how to work it. And you will never fail to be successful. It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufactories carried on on my own account, have not only given me lessons, but more than ordinary ability. I was the first one in California who successfully extracted silver by smelting, and have since been traveling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work by kind of ores by their roasting, smelting, lixiviation, or chlorination process. I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works. My lately invented Roasting Furnace has the following advantages: A Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas, and therefore, when amalgamated, a large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores..... \$3 00 Copper ores..... 5 00 J. OS. MOSHEIMER, Practical Chemist and Metallurgist, etc. Office, No. 325 Montgomery street, San Francisco, Cal. 6v15-3m

Postage.—The postage on the MINING AND SCIENTIFIC Press to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and country. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg lines), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

WHOLESALE AND RETAIL DEALER IN FINE CUSTOM-MADE CLOTHING, AND GENTS' FURNISHING GOODS, TRUNKS, VALISES, CARPET-BAGS, Etc. at the Lowest Prices. 9v15-qr

MEUSSDORFFER, Nos. 635 and 637 Commercial Street, WILL INTRODUCE On Saturday, February 9, 1867.

An Entirely New Style of Cloth Cashmere Hat "YACHT HENRIETTA," Which are the most dresy Hat ever introduced on the Pacific Coast. Call and see them. 8v14

Acids! Acids! Nitric, Muriatic, Sulphuric, Chemically Pure, Manufactured by the Pacific Chemical Works, FALKENAU & HANKS, 8v16alt 623 Montgomery street, San Francisco.

International Hotel, JACKSON STREET, BETWEEN MONTGOMERY AND KEARNY STS. SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices varying from \$1 50 to \$2 per day for Board and Room. FINE BATH HOUSE and BARBER SHOP ATTACHED TO THE HOUSE.

Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city (for 60 cents) 21v12 F. E. WEYGANT, Proprietor.

SACRAMENTO SEMINARY, Boarding School for Young Ladies, I street, between Tenth and Eleventh streets, Sacramento. The present Session commenced July 29th, and will close December 20th. A full course of instruction is given. Six Teachers are employed. For further particulars, Address HERION FERRY, Sacramento, Cal. 11v15-4m

Blanks, Blank Mining Books, Constitution and By-Laws - Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press. Orders from the Interior faithfully attended to. New Mining Advertisements.

Gold Quarry Company, Location of Works: Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of September, 1867, an assessment of twenty dollars (\$20) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, room No. 10, second floor of No. 402 California street, San Francisco.

Gold Hill Tunneling Gold and Silver Mining Company, Location: Gold Hill Mining District, County of Storey, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of September, 1867, an assessment (No. 9) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, in San Francisco, Cal.

George Washington Gold and Silver Mining Company, Location of Works: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1867, an assessment (No. 19) of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, in San Francisco, Cal.

La Blanca Gold and Silver Mining Company, Location of Works: District of Ures, State of Sonora, Mexico.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Lady Franklin Gold and Silver Mining Company, Silver Mountain Mining District, Alpine County, California.

Notice—There are delinquent upon the following described stock, on account of assessment levied on the second day of May, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Champion Mining Company—District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of September, 1867, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Lady Bell Copper Mining Company, Low Divide Mining District, Dal Norte County, California.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the twelfth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1867, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, George H. Faulkner, No. 423 Front street, San Francisco.

Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the fifth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Ancient River Channel Blue Gravel Company, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of September, 1867, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, in San Francisco, Cal.

Ancient River Channel Blue Gravel Company, Nevada County, California.

Notice—All persons are cautioned against purchasing the following Certificates of Stock in the Ancient River Channel Blue Gravel Company, as the transfer has been stopped on the same: One Certificate, No. 32, for 125 shares; one Certificate, No. 6, for 19 shares; one Certificate, No. 27, for 15 shares.

Chalk Mountain Blue Gravel Company, Location of Works: Nevada County, California.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the thirteenth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Engle & Corcoran Silver Mining Company, Location of Works: Storey County, State of Nevada.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of July, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Whitman Gold and Silver Mining Company, Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, room No. 10, 2d floor of No. 402 Montgomery street, San Francisco.

Camargo Gold and Silver Mining Company, Lander County, Nevada.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-first day of June, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Hancom Copper Mining Company, Location: Low Divide District, Del Norte County, California.

Notice—There are delinquent upon the following described stock, on account of assessment levied on the twentieth day of July, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the fifth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Kelley Gold and Silver Mining Company, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of September, 1867, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, in San Francisco, Cal.

La Blanca Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice is hereby given, that the Annual Meeting of the stockholders of the above Company, will be held at No. 163 California street, corner of Davis, in San Francisco, on THURSDAY, the tenth day of October, 1867, at 7 1/2 o'clock, P. M.

Mount Teabo Silver Mining Company, Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of September, 1867, an assessment of three dollars (\$3) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, in San Francisco.

Engle & Corcoran Silver Mining Company, Location of Works: Storey County, State of Nevada.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of July, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Whitman Gold and Silver Mining Company, Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, room No. 10, 2d floor of No. 402 Montgomery street, San Francisco.

Engle & Corcoran Silver Mining Company, Location: Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of September, 1867, an assessment of fifty cents (50c) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company 408 California street, San Francisco.

Oxford Beta Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1867, an assessment (No. 2) of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Potrero Company, Location of Works: San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of two dollars and a half (\$2 1/2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at No. 533 Kearny, corner of Sacramento street.

Silver Spring Mining Company, Location of Works and Mines: Kearsarge District, Inyo County, Cal.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the sixth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows: Names. No. Certificate. No. Shares. Amount.

Santa Cruz Petroleum Oil Works Company, Location: County of Santa Cruz, State of California.

Notice—The fifth Annual Meeting of the stockholders of the above named Company will be held at their office, 415 Montgomery street, San Francisco, California, on Tuesday, the twenty-fourth day of September, 1867, at 7 1/2 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year, and transacting such other business as may properly come before it.

Whitman Gold and Silver Mining Company, Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, room No. 10, 2d floor of No. 402 Montgomery street, San Francisco.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the greatest number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

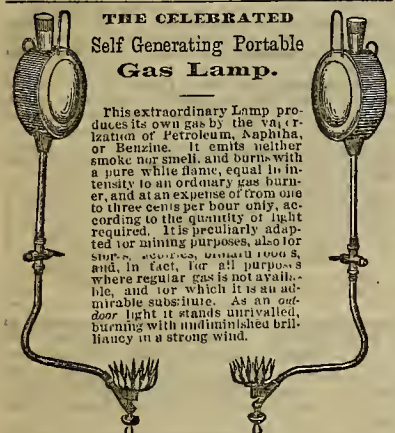

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pen being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the PACIFIC FOUNDRY, San Francisco.

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits no smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for shops, residences, and hotels, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cap, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the burner pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vice and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 13414-31-3

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, hearing date January 9th, 1855.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, 14141st Agents for the Pacific Coast.

E. O. HUNT, Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping it at any angle to the wind. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, single and Double-Acting. Frames and Gearing for running them, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 23 Second St., and 105 and 110 Deshler St. 2v13qy San Francisco.

BLAKE'S QUARTZ BREAKER! PRICES REDUCED! MACHINES OF ALL SIZES FOR SALE

WM. P. BLAKE, Corner First and Mission streets, or Box 2,077 3v13z SAN FRANCISCO.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine, for Breaking or Spalling Quartz, or other Rock, possessing as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1.—0 or 1 inch Crusher, capable of reducing from one to four tons of quartz per hour, no piece being larger than a walnut—Price, \$600

No. 2.—0 or 1 1/2 inch Crusher, capable of similarly putting through five to six tons per hour. 850

No. 3.—0 or 1 1/2 inch Crusher, will in a similar manner crush from seven to eight tons per hour. 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to crush to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, G, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Vulcan Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1856.

JAMES BRODIE, Esq., San Francisco: My Dear Sir: I receive your measure to which you that I have for the last three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED OERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1854. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1856, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1856.

BRODIE'S PATENT WIND BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press, of Nov. 25th, 1856. BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

LEFFEL'S American Double Turbine WATER WHEEL.

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE UNITED STATES, have never been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

Callifornia Waterworks, San Francisco; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coyne, Lexington, Santa Clara County; J. Y. McMillan, Lexington Santa Clara County. Send for Circular, to KNAFF & GRANT, Agents for California, 26v131yq 310 Washington street, San Francisco

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a first class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO., Pacific Iron Works, San Francisco, Aug. 29, 1857. 9v13tt

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draftsmen, by applying to this office.

PATTINSON'S HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15-gy THOMAS PATTINSON.

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, For Wells, Fargo & Co's Express. 11v15 6m

NELSON & DOBLE, AGENTS FOR

Thomas Firth & Sons' Cast Steel Files, Etc., Shear, Spring, Oerman, Plow, Blister and Toe Calk Steel; manufacturers of

Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine street, Between Montgomery and Sansome, San Francisco. 11v14j

Quartz Mill Construction and Superintendence

THE UNDERSTONED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a quartz mill. Has had five years steady and successful experience in working ores in Washoe and I. practiced in saving sulphuric and treatment of rebellious ores. I prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address J. SHAW, San Francisco, care Mining and Scientific Press. 26v143m

Notice to Miners, Well-Borers and Water Companies,

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for the branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi stoves, the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG, 8v13 1y Stove Store, No. 123 Clay street, below Davis.

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT. PICKERING'S GOVERNORS For Steam Engines.

Giffard's Injectors, For Feeding Boilers.

Beale Street, San Francisco. 2v12 3m

Pacific Mail Steamship Co's STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA. LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK: On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 18th and 30th of each month that has 31 days. When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on the following day.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco. Departures of 14th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following steamships will be dispatched on dates as given below: September 10th—GOLDEN CITY, Capt. W. F. Landge, Connecting with HENRY CHAUNCEY, Capt. Gray

September 18th—CONSTITUTION, Capt. Parker, Connecting with the RISING STAR, Capt. Conner

September 30th—GOLDEN AGE, Capt. J. M. Cavarly, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attend-ance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, and vice versa.

For Merchandise and Freight, apply to the Agents at the above offices. Holders of orders will be required to identify themselves to the Agents in England.

For the Steamship CHINA, Capt. E. W. Smith, will be dispatched October 14th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be overestimated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

[Written for the Mining and Scientific Press.] Letter from Placer County.

DUTCH FLAT, Sept. 16th, 1867. SCIENTIFIC MINING.

EDITORS MINING AND SCIENTIFIC PRESS:

Hydraulic mining is more or less remunerative in proportion to the amount of dirt washed. Where the pay is only fairly remunerative, the appliances must be good, and greater skill is required. An illustration of practical scientific mining has recently been furnished in the Gold Run district.

Mr. W. L. Hawkins commenced fitting up his claim late last summer. He did not, however, complete his appointments—which were most thorough—until in February. These consist of 700 feet of alternate flume and ground sluice, a fall at pressure of 208 feet. He opened out, or commenced washing through a shaft at the depth of 27 feet, using three pipes and 350 inches of water. He turned on water on the 14th of February. He has extended the main flume over ground washed away between 700 and 800 feet, with a branch flume on either side. He has a front depth of bank of 180 feet. A cave now carries down an immense amount of dirt, and requires several days to wash it away. He is now running night and day, and getting a good reward for his unrelaxing energy.

HYDRAULIC POWER.

The King Brothers, of this place, have a mill for crushing cement, driven by a centrifugal wheel. The buckets are of a novel pattern, and the wheel is, we are informed, with one exception, the only one in use. They are pieces of boiler iron in form about five inches in width by eight in length, bent so as to form a concave, resembling in shape the mold-board of a plow. The rim is in two sections, placed sufficiently far apart to receive the buckets to which they are attached. The angle at which the water strikes the buckets, causes it to deflect or pass a little to one side of the plane of motion of the wheel, thus keeping it clear of water. But its chief utility consists in always presenting a clean surface, against which the stream of water strikes, thus obviating any loss of power from the reaction of water, which, in other forms of buckets, does not entirely escape.

In this mill, from 30 to 35 inches of water, under a pressure of 144 feet, striking against a wheel eight feet in diameter, drives eight 500 pound stamps.

By experiment this is shown to require about 20 inches less water than other forms of buckets which have been tried.

METALLURGIC.

Dr. A. T. Dozier, of the "Dozier Metallurgical Company," leaves here to-day for Benton, Mono county, to superintend the construction of works for the reduction of ores. They will be located at Benton near the Camanche, owned by the Harkness Bros., one of an exceedingly rich group of veins, the ores of which have hitherto baffled all attempts to reduce them at the mine. M. F.

MINING PATENTS—ADVERSE CLAIMANTS.

Commissioner Wilson has ruled that in case of adverse claims, it will be necessary for the contestant to file with the Register and Receiver a statement showing the correct description of the mine, the title to which is in dispute, also the extent of the premises in conflict; and should the statement be sustained by satisfactory proof, these officers are authorized to stay further proceedings until final adjustment shall have been had in the Courts of law. Adverse claimants are not required by law or instructions from the General Land Office to make applications for patents, nor to incur the expense of surveying and advertising in order to warrant a stay of proceedings. These applications, supported by proper testimony, showing interest in the conflicting claims, are deemed sufficient authority to the Registers and Receivers for a stay of further proceedings, yet the adverse showing must be filed before the expiration of the ninety days' notice. When thus filed, the Surveyor General will refrain from ordering a survey of the claim in controversy until the contest is finally adjudicated by the judicial tribunals. In case the adjudication is favorable to the original claimant, then the survey is to be made on application by him to the Surveyor General; but if the adverse claimant is sustained by the Court and desires a patent, in that event he must file in the local Land Office regular application for a survey and patent to the extent of his claim; or, if he so desire, he need take no steps in that direction, should there exist no adverse interests to the premises.

RANSOME'S ARTIFICIAL STONE.—The following is the mode of manufacture, as we find it in the London Mining Journal:

A quantity of sharp, clean sand, fine or coarse, according to the description of work needed, is mixed in a pug-mill with a solution of silicate of soda, until of about the consistency of half-made mortar. This material is forced into molds, or made into balls, into roofing tiles, ornamental boxes, balustrades, or any other useful or ornamental articles such as are to be seen in cut stone. When in this state it is soft, and will readily yield to a slight pressure. When the molding is taken from the mold it is at once saturated with a solution of chloride of calcium. The two solutions thus coming into contact, chemical action sets in. The hydrochloric acid leaves the calcium and seizes on the soda, forming a solution of common salt, while the silicic acid, leaving the soda, seizes upon the calcium, and forms silicate of lime—the most enduring stone with which we are acquainted. As the block is porous, the salt is readily washed out, and leaves a quantity of sand cemented together by silicate of lime. The only matter of doubt concerning the material seemed to be its durability; and as to that point, though a longer experience than fifteen or twenty years cannot as yet be appealed to, science tells us that the material is what may be called indestructible. As to the strength of the material, some experiments were tried, and a block of about five or six inches cube was broken by a pressure of forty-five tons in the hydraulic press, while a block of Portland stone, of the same size, was crushed by a weight of four tons. A small block surface, two and one-quarter square inches, gave way under a tension of eight hundred and seventy pounds—these blocks not having been made longer than a week previously.

GAS AND WATER.—An English civil engineer, named Ormsby, gives an opinion that where water pipes and gas pipes are laid near each other it is highly injurious to the quality of the water. He gives an instance in proof of his assertion, where, in applying a light to some water pipes that had laid a long time in juxtaposition with gas pipes, ignition was caused, the same as if they had contained gas instead of water.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 28, 1897. TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$35.

The Commercial Herald — AND — MARKET REVIEW Will be issued early on EVERY STEAMER-DAY MORNING, (TRI-MONTHLY).

Office—Southwest corner Washington and Battery streets, Opposite Post Office and Custom House.

The HERALD will contain full and reliable commercial details, and elaborate articles on the monetary affairs of the Pacific Coast.

The Letter Sheet Market Review, Containing selections from the COMMERCIAL HERALD, printed on tissue paper, for transmission abroad, will be published simultaneously with that paper. Also, publication office of the

Weekly Stock Circular. Merchants can have their cards prominently inserted in the Letter Sheet MARKET REVIEW.

THE CENTRAL PARK OF THE PACIFIC. Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, — AND — ZOOLOGICAL GARDENS.

ORANO INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays an ORANO CONCERT OF SACRED MUSIC, appropriate to the occasion.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast. The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic. To all departments new attractions are being constantly added. These Gardens are accessible by the Howard and Market street Cars. Entrances on Mission and Valencia streets, between Thirtieth and Fortieth, OPEN EVERY DAY. Admission to all parts, 25 CENTS. Children, under 12 years, half price. 1691qr

LACOUR'S SARSAPARIPHERE BITTERS. Have so speedily grown in favor that their unrivalled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the ineness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry. The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to his thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

LACOUR'S SARSAPARIPHERE BITTERS. They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by cutaneous excretions, and other substances which promptly stimulate the secretions of the lower glands and organs, render digestion easy, obviate costiveness, and remove regularly every impurity of the blood. They are unrivalled as a remedy for Scrofula, Dyspepsia, Constipation, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

Who Takes Them? The Old Man Takes them as a gentle stimulant and mild rejuvenator. The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overworked body. The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health; to give a sparkle to her eyes, and sweetness to her breath. The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family. The Wife Takes them to invigorate and strengthen her system, end as an aid to nature in regulating her periodical sickness. Children Take them as a gentle, yet effective tonic. The Dasha-way Takes them as a mild, pure stimulant, containing none of the deleterious, essential and unjust oils of forbidden drugs. The Inebriate Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does not madden or destroy. The Traveler Takes them to prevent sea sickness, and secure his health against change of climate. Everybody Takes Them! PRO BONO PUBLICO! 2v15-6m

Assayer and Chemist. A GENTLEMAN WELL VERSO IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office. 3v15-12

MULBERRIES AND HOPS.—Messrs. Flint & Haynie, near Sacramento, have in their nursery one hundred thousand young mulberry trees. They will have this season twenty thousand dollars' worth of hops. They have also a "Patent Hop-kiln," of Mr. Haynie's invention, by means of which the hops are dried without such a waste of the precious lupinin in which their virtue lies, as was unavoidable with the old kiln.

DEPOT FOR MACHINERY.—We would call attention to the advertisement of E. T. Steen, in our issue of to-day. Mr. Steen is prepared to suit everybody who wishes either to buy or to sell machinery of any kind. Call on him at 608 Montgomery st.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. Lutz, Secretary. Office, 308 Montgomery street, corner of Pine, San Francisco. 2v16

Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866: I. Applicants' Declaratory Statement. II. Diagram, Description of Diagram and Boundaries, and Notice. III. Register's Order for Publication—with Notice. IV. Deposition that Notice has been Posted. V. Application for Survey Etc. PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid. Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

THE GOLDEN ERA.

Founded in 1857, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and also not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exerting a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

New Patents and Inventions.  
San Francisco Metal Market.

MECHANICAL MISCELLANY.—  
Beam and Oscillating Engines; The Manipulation of Metals; New Process for Making Steel and Wrought Iron; To Remove Rust from Iron.  
SCIENTIFIC MISCELLANY.—  
Light and Heat of the Sun; Remarkable Vegetable Phenomena; The Purification of Water; Cadmium in the Assay Office; New Use for Aluminum Bronze; Clearing Glass.  
MINING SUMMARY.—Embracing late intelligence from the various counties and districts in California, Colorado, Idaho, Montana, Nevada and Oregon.  
San Francisco Market Rates.  
San Francisco Weekly Stock Circular.  
Stock Prices—Bid and Asked.  
Mining Shareholders' Directory.  
New Incorporations—List of Officers.

### Hunt's Double Action Pump.

We give, annexed, a view of Hunt's new double action pump, designed for use when it is desired to raise large quantities of water. These pumps are mounted as shown in the engraving, and also on frames fitted with gearing to be run by horse power. The valves are a new device, of superior design, and pronounced by those who have used the pump, equal in efficiency, simplicity and durability, to any in use. They can be removed and replaced in five min-

utes, by simply taking off the cap that is held in place by two bolts, as shown in front of the chest in the engraving. It is claimed for these pumps that they are capable of doing great service—that they are cheap, durable, strong and but little liable to get out of order. They are manufactured by E. O. Hunt, at his well known shop on Jessie street in this city.

CALIFORNIA MACHINERY GOING EAST.—The Panama steamer of Monday, will take out a complete set of quartz machinery, intended for a gold mining company in South Carolina! This machinery was made at the Union Foundry in this city.

### Dr. Beers' Patent Wire Gauze Amalgamator.

We give herewith an illustration of Dr. Beor's recently invented wire gauge amalgamator, for which a patent has just been issued. It is well known to all persons engaged in quartz or placer mining that great loss constantly occurs, not only from the escape of fine gold, but from the waste of small particles of amalgam and impure mercury, all of which are charged, to a greater or less degree, with gold. The object of the present invention is to secure the miner against such loss, by furnishing a cheap and more perfect amalgamator and one that can be easily applied to all gold mining, requiring but little attention and no motive power. We understand that the practical working of the invention goes far

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

to prove that the inventor has done much in improving the ordinary processes of amalgamation.

The nature of this improvement consists not only in furnishing a lodgment for particles of free gold, that would naturally be retained by its own specific gravity, but at the same time bringing and retaining the minutest particles in close contact with an amalgamated surface, charged with sodium amalgam or its equivalent. To establish these conditions and accomplish these results, two, somewhat different, devices are employed, viz.: For placer or hydraulic mining, a copper wire gauze mesh, of from one-eighth to one-fourth inch, is used, amalgamated and laid upon canvas on the bottom of sluices, riffle boxes, etc. If used in hydraulic mining it should be protected from boulders by placing a short length, thus prepared, beneath a grizzly, in the bottom of the main sluice, thus forming a riffle box, and which, if placed at a proper angle, will catch and retain all the gold that has been set at liberty above it, and enable the miner at the close of the day, in fifteen minutes, to clean up and collect the result of his labor.

For quartz mining another device is employed. In the present almost universal use of amalgamated copper plates, it is found that much of the gold, as it leaves the batteries, glides over the plates, not being retained long enough to become

amalgamated, especially when the surfaces are rendered too fluid by the use of mercury in the batteries. In such places the plates with iron gauze or corrugated copper plates, as shown at H, are intended to retain the gold until amalgamation takes place; and if, following this, there is employed a short sluice, lined with the amalgamated copper wire gauze, the lower end being allowed to dip into a small reservoir, where any drippings may be caught, very little if any mercury will be lost, which item alone, in most mining operations, would more than pay for the improvement every month. Cyanide of potassium or sodium amalgam is especially beneficial, in connection with this amalgamator. Referring to the illustration; A represents a section of the common sluice; B, screen or grating to admit only the gold and fine sand; C,

THE NEW ASYLUM FOR THE DEAF, DUMB AND BLIND.—The corner stone of this institution was laid on the 26th inst. The site is in Alameda county, six miles from Oakland, at the foot of the Coast Range of hills; and commands an excellent view of our noble harbor, and of the adjacent country. The property includes one hundred and thirty acres. The main building will have a frontage of 192 feet, with a height from the ground line to the top of the spire of 145 feet. It will be in the Gothic style, and constructed of sand-stone from the neighborhood, except the front facing. It is so arranged as to accommodate separately, not only deaf and dumb, from the blind, but the two sexes of both classes from each other. The lighting will be done by the Ensley patent gas, and the heating by hot water pipes. Especial attention has been paid to ventilation. As a whole, the design for the building has been especially praised, as promising elegance and solidity.

The exercises commenced at noon. Ira P. Rankin, President of the Board of Commissioners, who will superintend the work, stated the object of the meeting, and made a few general remarks. Rev. Dr. Stone offered prayer, which was *silently echoed*, so to speak, by Prof. Wilkinson, the Principal of the school, who, in the eloquent sign language, which alone is intelligible to those unfortunates, interpreted it as spoken, to the deaf and dumb who were present.

Prof. Wilkinson followed with an address. He gave a complete history of the institution from its inception to the present moment; and also a general summing up with dates, of the various steps of progress in the instruction of deaf mutes, and of the blind.

The peculiarly isolated position of the latter, and the scarcely less unfortunate condition of the former, were eloquently touched upon; and the address was, in scholarly style and aptness of illustration, a production which will be read with an interest equal to that with which it was listened to by an appreciative audience.

A poem, written for the occasion by Frank Bret Harte, was then read. Rev. J. A. Benton next produced a document in which were given the names of those concerned in the management of the institution; of the State, County and City officers present; of the President of the United States, the Governor of California, and the Mayor of Oakland. This document, together with divers others, and copies of the San Francisco and Oakland newspapers, pieces of coin etc., etc., was then and there sealed up in a glass jar, which was placed within a cavity cut in one of the outer stones, at the north-west angle of the building. The corner stone was then lowered upon it. Gov. Low, having gone through the appropriate masonic ceremonies, addressed a few remarks to the audience. He was followed by several others; and the regular exercises being concluded, the day closed with a general partaking of refreshments, under the supervision of Prof. Wilkinson.

rifle boxes; D, lining of copper wire gauze or canvas; E F, reservoir to catch any drippings of mercury, the end of which is shown open at E in the cut. H, section of corrugated copper plate for quartz mills.

OPENING OF THE COLORADO RIVER.—Especially attention is called to the advertisement of the Lower California Exploring and Prospecting Company, which appears in our advertising columns to-day. The subject of opening steam communication with Arizona and the Salt Lake settlements, by way of the Colorado river, is constantly attracting more and more the attention of the mercantile community. It is a subject which has been frequently discussed in the columns of the Press, and we are pleased to see the earnest effort which is now being made to open up this important highway to the inland commerce of the central-western portion of this continent.

The company already alluded to will forthwith proceed to explore the Colorado river, with a good steamer and also to prospect the territory of Arizona with a force of 250 men. We understand that they have procured the services of parties who are well acquainted with the country. Each shareholder is entitled to a lot in the new town of San Diego gratis, and all families of stockholders are transported thither in the vessels of the company, which sail Nov. 1st, free of charge. Further information can be obtained at the company's office, No. 20 Montgomery street.

## Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Entered according to Act of Congress in the year 1866, by F. A. Herring, in the Clerk's Office of the District Court of the District of California.]

## Formation, Distribution and Age of Igneous Rocks.

(Continued from Page 162.)

We will now, as gold is probably the earliest erupted of the nobler metals, consider some facts that have bearing upon the age, distribution and position of the more auriferous gravel deposits. J. A. Jennings, in the *MINING AND SCIENTIFIC PRESS* of May 19th, 1866, is impressed with the belief that "the once fluid mass of Table Mountain, Tnolumne county, which is now an immense wall of hard black lava two or three hundred feet higher than the country upon either side, was walled in by the banks of a river, and is the product of a volcano, now extinct, situated a few miles above Columbia. The lava followed the course of an ancient river some twenty or thirty miles, in a tortuous southerly direction, whose banks must have been a hundred, and in some places several hundred feet higher than the stream. Here and there may be found the junction of an ancient gulch, into which the lava flushed back; yet the old hills are gone that once covered this section of Tnolumne county—at least three hundred feet above the present level—and even the bed of the river, which has been worked by means of tunnels with the usual success of river mining, overlooks the surrounding country. The old hills are gone, and the method of their disappearance conveys some idea of the length of geological periods. Each winter's rain brings down a little sand, dissolves a little of the soluble particles of the rock and soil, and here we see the accumulated result. Rocks, soil and sand have all gone down the water course to the sea."

The fact that those ancient auriferous deposits are, some of them, miles in breadth and many miles in length and hundreds of feet in thickness, and composed entirely of quartz, gravel and boulders, is presumptive evidence that the material of which they are composed must be of volcanic origin. Some of them are situated near the summit of the Sierra Nevada, on their western flank; and I have been credibly informed by miners that in some localities large areas are covered with disintegrated quartz, which show no signs of having been subjected to the action of water other than that to which the summits of mountains are usually exposed. These deposits are, in many localities, thousands of feet above the body of the present water courses.

"Some idea of the immense changes which the face of the country has undergone since those ancient rivers found their way along what is now the flank of the Sierra, may be inferred from the fact that these beds have been covered by a detritus, a large portion of which is volcanic, to a depth of nearly or quite 1,000 feet. Since that deposit was made, the present system of rivers has had its origin, passing at a quarter or less angle across this ancient deposit, and in some localities, as at Forest Hill, in Placer county, they have cut their way down through this 1,000 feet of gravel and continued on from 2,000 to 3,000 feet in the hard slate rock below."—*Mining and Scientific Press*, May 12th, 1866.

"In some instances the beds of these underground streams appear to have been changed more than once. Some volcanic eruption has poured down its molten covering over the golden sands, gravel beds, and whatever else within the channel. The river, then, for a time, flows over the lava or other volcanic debris, until another alluvial deposit is made. Another layer of lava from a second eruption follows; and thus alternately until the river is turned from its banks to seek another channel, sometimes parallel, at others with its direction changed entirely."—*Prospectus in Mining and Scientific Press*.

I wish particularly to call the attention of the reader to the fact that the more ancient gravel deposits are, some of them, covered and protected from denuding agencies by an indestructible non-metallic rock, and in some instances that those ancient deposits

thousands of feet above the beds of the present veins are interstratified with lava. It is the concurrent testimony of geologists that unchanged igneous rock is first found interstratified with the formations of the carboniferous era.

A few miles, in a northerly direction, from Oroville, situated at the western base of the Sierra Nevada, are two table mountains, from three to six hundred feet above the bed of the present water courses. An extensive auriferous gravel deposit, known to be seven or eight miles in length, passes directly under these table mountains, in a northerly and southerly direction. The gravel from a few feet on the westerly flank to as much as six hundred in thickness under Sugar Loaf Mountain, which seems to be composed of quartz gravel, and is situated to the east of the table mountains, the deposit being thinnest upon the western flank. Under the westerly end of the northerly table mountain there is a bed of coal six feet in thickness. The quartz gravel both under and overlies this coal bed, which shows that the coal formation was deposited upon the flank of this ancient mountain of quartz gravel, and was afterwards covered by the detritus from it, brought down by the action of water. Underlying this vast deposit of quartz gravel is a stratum of the famous blue gravel or cement. As far as my observation goes, where the blue cement exists, it invariably underlies all other auriferous deposits—a fact which sufficiently indicates the character of the earliest erupted gold-bearing rock—viz: magnesian rocks.

When the hard black lava which caps this table land was erupted, the surrounding country in its immediate vicinity must have been nearly or quite level with the present summits of the mountains. The table mountains, which are now divided by Morris ravine, appear to have been originally connected, and to have had a much greater breadth than now. But the soil and rocks which originally composed the surrounding surface has been carried away by denuding agencies slowly undermining the lava, which toppled outwards, until it now presents a perpendicular face from twenty to perhaps one hundred feet in height and thickness. Further north, along this volcanic axis, is a large area covered with lava, a few miles in breadth, and extending northerly some seventy miles to the Sacramento river. Underlying this deposit of lava is a bed of auriferous quartz gravel, which, in some places, is known to be of great thickness, and it probably exists in varying quantities all along the line of the lava deposit. South of Oroville, in Butte county, at Bangor, there is another gravel deposit, which appears to be the bed of an ancient river, running in a northwesterly direction, and underlying the beds of the present water courses, in some places at least 100 feet.

Still further south along this volcanic axis there has recently been discovered another remarkable quartz deposit. I am indebted to Mr. P. J. Hopper, of the *Folsom Telegraph*, for the following description of it: "This newly-discovered deposit rests on the granite, and it contains no kind of stone except quartz, in pieces varying in size from the smallest particle to the size of a man's head, and is said to contain fine gold. The miners are working upon the granite, and find it sloping downward underneath the hills, and the cement upon it increasing, both in thickness and richness, until, in some claims, it is twelve feet thick. The gold taken out is of a rusty color, coarse and irregular in shape, like gold found in quartz rock. It is not smooth or water-worn, and the miners insist that it is an original deposit. The deposit is much lower than the bed of the American river. This quartz gravel deposit lies upon the hard gray granite, and underneath a marine formation containing shells, which, in some places, is twenty feet thick. Overlying the marine deposit is a rock the miners call lava, which has hitherto been considered the bed rock, and all mining operations have hitherto been confined to strata which rest upon the 'lava' and marine formation."

Granite was intruded along the anticlinal lines formed by the upheavals of the silurian period immediately preceding the eruptive era of metalliferous quartz. Here in this newly-discovered mine we have decomposed quartz, which carries no indication of attrition, resting upon a cone of granite, forming an ancient anticlinal axis, which was evidently above the level of the sea, as there is no deposit of any kind between the stratum of disintegrated quartz and granite. This auriferous deposit was never carried to its present position by water, and its presence upon the summit of this ancient anticlinal axis can only be accounted for on the supposition that the quartz was erupted from a long extinct volcano.

(To be continued.)

[Written for the Mining and Scientific Press.]

## A Visit to the Royal Saxon Mining Academy at Freiberg, Saxony.

By W. P. BLAKE, Commissioner from the State of California.

EDITORS PRESS:—I had nearly completed a third letter to you from the Paris Exposition, giving you an account of the iron and steel, when I learned from some of my young mining friends that the Freiberg Academy was about to close for the summer vacation. I therefore left the Exposition for a few days, and took the railway train, which carried me through the north of France, by Compeigne and Liege to the Rhine at Cologne; thence through Belgium, Northern Germany and Prussia, by Dusseldorf, Hanover, Magdeburg and Leipzig to Dresden, in thirty hours from Paris. The country everywhere presented a most charming appearance, being nearly all under high cultivation, and checkered with fields of grain, potatoes and clover. Harvesting had just commenced, and women were at work in the fields with the men, gathering and binding the wheat. Comfortable-looking farm-houses and whole villages, with quaint high-peaked roofs covered with red tiles, were passed in rapid succession, while an iron furnace here and there, and cities at intervals, with forests of tall smoking chimneys and long lines of furnace fires, showed that mining and manufacturing were hand in hand with agriculture in the enrichment of the country.

Freiberg is but two hours distant by rail from Dresden. The road ascends the valley of the Mulde river by steep grades, and on nearing Freiberg circles around a deep basin-like bend of the valley in which the great smelting establishments are placed.

The ores are brought here from the mines for reduction, and silver, gold, lead, copper, zinc, cobalt, arsenic and sulphuric acid are produced. A hundred furnaces and chimneys are belching out sulphurous smoke and gases, and clouds of white zinc and arsenic fill the air. It seemed like looking down into a great solfatara, or the smoking crater of a smouldering volcano. There certainly was no resemblance in those groups of furnaces to any of our amalgamation works, and I have since found that the Freiberg ores are beaten by fire alone, amalgamation in barrels having been abandoned long ago.

In a few moments more I was in Freiberg, and driving to the Hotel de Saxe, received a hearty welcome from the California and other students from the United States. There are at present about forty students from the United States, or about half of the whole number of students in the Academy. Six or seven of these students are from California, and they are general favorites. Most of the others are from New York and Massachusetts, and there are some from Virginia and South Carolina. There are students also from South America, Mexico, Java, and Russia.

The lectures for the season had just closed, and great preparations were making by the students to celebrate the one hundredth anniversary of the foundation of the Academy. The centennial in fact came last year, but the presence of the Prussian soldiers rendered any great display by processions or otherwise, inconvenient, and the ceremonies were postponed until this year. The programme devoted three days to the festivities; to concerts, processions, speeches, a dinner, a ball, and a final convivial meeting of all the students, the old graduates, the professors, and the guests. This took place last evening, and the celebration is now ended.

From the time of the first proposition, the greatest enthusiasm has prevailed among the students and among the people. Nearly every house in the place was decorated with garlands and wreaths of oak leaves, and were illuminated in the evening. The only exception of note was the house of the chief government Director of the Mines, who has gained the ill-will of almost every one by refusing to allow the miners to take part in the procession. This procession was a grand display. The students appeared in their full mining costume, with their marshals, national flags and bands of music, and were

joined by the different civic societies and trades organizations of the place. The route of the procession was crowded with spectators, and was strewn with flowers and bouquets thrown from the windows above by Saxon beauties, and a large share of these favors fell to the American students. The procession paused in front of the Academy, under the tablet to the memory of Leopold von Buch, at Werner's monument, at the tablet of Theodor Koerner, and again at the house formerly occupied by Alexander von Humboldt, and at all of these places short addresses were made, honoring the memory of these illustrious savans, graduates of the Academy, or identified with its history.

A grand dinner in the Town Hall succeeded the procession. In this the professors of the Academy and the guests took a part. Amongst them were the venerable Breithaupt, the distinguished mineralogist; Botta, the geologist; Weisbach, the author of the work upon mechanics; Weisbach, Jr., now the professor of mineralogy; Scheerer, the chemist; Gaetschman, the lecturer on the mechanical preparation of ores; and Ziervogel, the author of the celebrated silver extraction process, which bears his name.

We were interrupted in the midst of the dinner by the arrival, in the street outside, of a procession of 1,000 miners from the Himmelfahrt mine. They had assembled in spite of a prohibition, and were determined to have a part in the celebration. It was interesting to look down from the windows of the hall upon the upturned faces of these men, all begrimed with the smoke of gunpowder and the dust of the ore. One of their number mounted a barrel and made a speech, thanking the students for honoring the day, and expressing the regret of the miners that they had not been allowed to take part in the grand procession of the morning. Free beer and cigars were liberally dealt out, and under their influence the miners' enthusiasm culminated in an attempt to smash the windows of the odious Director-General. The King's soldiers were called out, and the honest miners were driven home at the point of the bayonet.

At the hall in the evening, the guests were much interested in the model of a mine, from which two little boys, dressed in the quaint mining costume, kept bringing out supplies of bon-hons, put up in little cardboard boxes, shaped like crystals.

The celebration ended the next evening, at a grand *commers* of all the students. After singing several humorous songs, and drinking moderately of beer, they join hands across the table and swear to be brave, loyal and honorable men, and in token impale their caps upon the swords of their leaders.

During the progress of the celebration, I visited the collections, the smelting establishments, and several points of interest, among them the tomb of the great Werner. His last resting-place is marked by a modest slab in the yard of the great church nearly opposite the "golden door" of wonderful sculpturing. It is inscribed simply with his name—ABRAHAM GOTTLIEB WERNER—and the date of his birth and death, with two flaming torches sculptured, one erect and the other turned down. Masses of quartz crystals and of glittering ores are piled around, and are now nearly covered by ivy.

The students have now commenced their summer course of practical instruction at the furnaces. They rise at six in the morning and walk two miles out of town to the Mulde works. There an assistant professor describes all the furnaces and processes in detail, and permits the students to take drawings and notes in full. This is a very important part of the instruction at Freiberg, and it appears to be appreciated by the students. I have seen many note-books intelligently filled, and feel satisfied that the young men who are here from the United States are improving their precious opportunities. At any rate, the Americans are great favorites with the professors, who consider them, in general, as the best students.

One of the greatest disadvantages to a student who comes here from the United States, anxious to progress rapidly in mining studies, is the ignorance of the language. A residence of one year is necessary before he can thoroughly comprehend the instruction which is given. Again, those young men who have not had a previous theoretical or practical training in American mines, find themselves at the close of their course quite ignorant of English and American mining terms. It has actually been gravely suggested that, as the majority of the students here are American and English, the lectures should be given in the same language.

In my next I hope to give you some facts of interest about the mines and products of this place.

## Mechanical.

## Beam and Oscillating Engines.

THEIR COMPARATIVE ADAPTABILITY FOR MARINE SIDE-WHEEL STEAMSHIPS.

A friend has placed in our hands a small pamphlet, evidently issued by the Pacific Mail Steamship Company, from their office in New York, and intended for circulation among the agents, commanders and engineers of that company, wherever they may be. The pamphlet contains a brief, succinct statement of facts and considerations in reference to the relative advantages of beam and oscillating engines for marine steamships, prepared by Horatio Allen, Esq., President of the Novelty Iron Works, of New York. Mr. Allen is well known to the mechanical world as one of the foremost engineers in the country, thoroughly skilled, and of great experience in his profession, both practically and theoretically. As a builder of marine engines, he has no superior in this or any other country. The object of the pamphlet is to bring this statement of facts to the knowledge of the skilled employes of the company, so that it may be attentively studied and freely criticised by them, in order that the company may have the full benefit of their practical experience in reaching a correct conclusion on so important a subject, as a radical change in the construction of marine engines.

We owe no apology to our readers for placing before them a brief abstract of the evidently carefully considered paper before us. Mr. Allen tells us, in his preliminary remarks, that his object is simply to call attention to facts and considerations, such as, in themselves, constitute the grounds of preference, and not to leave the settlement of such important questions to the influence of general declarations of superiority. In order to make the comparison as practical as possible, he confines himself to engines of a particular size—85-inch cylinder with eight feet stroke—which have been built by the Novelty Company and actually run.

He begins with the statement that the power developed in the two engines, of same dimensions, revolutions, pressure, and quantity of steam and degree of expansion, will be the same, if the friction is equal; and then proceeds to give, in a clear and concise manner, the essential particulars in which the beam engine differs from the oscillating. These statements we reproduce in a somewhat condensed form, as follows:

1st. The room occupied by the oscillating engine is 8,500 cubic feet—by the beam engine, 14,750; being as 1 to 1.73 in favor of the former.

2d. Weight of the oscillator, 138 tons—of the beam engine, 152; an advantage of the former as 1 to 1.11.

3d. The number of parts through which the power is transmitted, from piston to crank, in the oscillator is 3—piston, piston-rod and pair of trunnions; in the beam engine the number is 9. Difference, 1 to 2.25.

4th. Number of parts to be constructed in true line and relation to each other are, in the oscillator 4—beam engine 6.

It should here be borne in mind that in all combinations of machinery, by which power is transmitted, the greater the number of intervening parts, the greater the skill and care required to have the parts all in their relative and proper adjustment, and the greater the chances for unsatisfactory performance.

5th. The number of bearings and their brasses to be kept properly adjusted and lubricated in oscillator is 5—in beam engine 13. Difference, 1 to 2.6.

6th. Friction—no difference; as has been proven by actual measurement.

7th. Power delivered on the crank pin, equal—a necessary consequence of equal power on the pistons and equal friction.

8th. The structure through which the power is transmitted from the cylinder to the crank.

In beam engines the pillow block or top of a gallow's frame of wood, is the fulcrum through which, by means of the beam, the

power is transmitted to the crank. On this pillow block double the power of the engine acts; at one time to force it down, at another to force it up. The down strain is met by the legs of the frame, supported by the keelson, and the up strain by the holding down bolts, which pass through the keelson, and are held by nuts and washers. This combination of the gallow's frame is found very difficult of construction, and often after great pains has been taken to properly secure it, a short time only elapses before the holding down bolts require screwing up—hence great difficulty arises, requiring constant care and attention. The strain of the engine is also thrown, to a great extent, on the vessel's bottom, to its serious detriment, to say nothing of the liability of the wood to decay, thereby entailing great expense and delay.

In striking contrast with these particulars, are found the conditions of the oscillating engine, particularly with regard to the manner in which the strains are met. The pillow blocks of the wheel shaft are directly over the pillow blocks of the trunnions of the engine, and the two are connected with four large wrought iron columns, capable of sustaining the entire force of the engine—either in separating or crushing; while all the power of the revolution is developed without any transmission of up and down strains on the bottom of the vessel.

11th. The relative advantage of being used as a single engine is much in favor of the oscillator, from the fact that all the working parts of the beam engine come to a state of rest while it is passing its center, over which it is carried by the momentum of its wheels; while in the oscillator the weight coming to a state of rest, is much smaller, and the oscillation of the cylinder, being at that moment at their highest motion, greatly aid the wheels in enabling the engine to pass its centre.

In the beam engine, the weight coming to a stand still, is 20 tons—in the oscillating engine the same weight is 6½ tons. The weight in motion to aid in passing the center in the oscillator is 30 tons more than in the beam engine.

12th. As to the valve gear and working by hand, it is claimed that the advantage, though small, is in favor of the oscillator. The oscillator requires more parts by which to operate the valves; but it involves no more mechanical combinations, by which their working is effective.

13th. The means of working the air pump are equal.

14th. As to accessibility of journals on the cylinder, any journal carried by the oscillating cylinder is as accessible as in the cylinder of a beam engine.

MANIPULATION OF METALS.—Very few persons except workers in metals, are aware to what extent the shaping of cold metals is practiced in the mechanical arts. Metals usually denominated solids, have been found to have a flow similar to that of the same metals fused; for cold rolling, stamping, pressing, tube drawing, are all examples of the flow of metals—the movement of particles one upon another without destroying their cohesion. Every housewife now knows that she obtains metal cups, basins, pans, and kettles, without seam or solder, in forms and sizes that formerly were considered impossible except by using separate plates. Pencil tubes are now all drawn out of a flat piece of silver or gold, and a pile of lead plates has been forced into a series of concentric tubes, one within another, while a plate of tin and lead have been drawn into tubes so as to form a tin pipe perfectly encased in lead. It is but a few years since such processes would have been deemed impossible, and they show the rapid progress made in the mechanical arts.

NEW PROCESS FOR MAKING STEEL AND WROUGHT IRON.—Mr. Siemens of England has patented a process for making steel and iron directly from the ore, which differs from that introduced by Mr. Rogers in New Jersey, several years ago, only in the substitution of rich hydrocarbonous for pulverized charcoal. The iron ore, in a finely divided state, is heated in a closed vessel, and brought in contact with hydrocarbon currents, which percolate through the mass of ore and unite with the oxygen of the ore, thus reducing the metal.

TO REMOVE RUST FROM IRON.—Pound glass to a fine powder, having nailed some strong woolen cloth upon a board, lay upon it a strong coat of gum water, and sift thereon some of the powdered glass; let it dry; repeat this operation three times, and when the last covering of powdered glass is dry, you may easily rub off the rust from the iron with the cloth thus prepared.

## Scientific Miscellany.

## Light and Heat of the Sun.

Calculations based on the light and heat radiated from the sun, show that the temperature which exists at its surface must be so great that, until recently, we have been scarcely able to form any adequate idea of its intensity. Modern chemistry, however, has finally come to our relief, and developed some curious facts with regard to the chemical relations of intensely heated matter, which throw much light on what has heretofore been considered almost inexplicable, with regard to the supposed heat and luminosity of the sun's surface. Chemical science has shown that a comparatively moderate temperature is favorable to chemical combination; while a high temperature evers the same affinities and decomposes. Thus certain metals, at a low temperature, unite with oxygen and other elements, while these same compounds, when exposed to a higher degree of heat, separate into their original elements or form new compounds, and leave the metals in a pure state. A similar action and reaction takes place with water, whose elements—oxygen and hydrogen—when mingled in the presence of carbon and subjected to a moderate degree of heat, as in the burning of a kerosene lamp, unite and form water. But let that water be then subjected to a still higher temperature, and it is at once resolved again to its original elements. Recent researches have shown that this breaking up of compounds or distribution of elements by intense heat, is a principle of universal application; so that we may suppose that all the elements which make up a world would, when so intensely heated as to be in a gaseous condition, exist in an uncombined state. It is in just such a condition that we suppose the sun to be at the present time.

Reasoning from these facts and suppositions, Mr. Faye has recently promulgated the following hypothesis with regard to the nature of the sun, and of the hitherto inexplicable luminous process going on upon its surface:

The sun is to be conceived as an immense mass of intensely heated gaseous and dissociated matter, so condensed, however, that, notwithstanding its excessive temperature, it has a specific gravity not much below that of water, probably offering a condition analogous to that which Cagniard de la Tour observed for volatile bodies when submitted to great pressure at temperatures much above their boiling point. The radiation of heat going on from the surface of such an intensely heated mass of uncombined gases, will produce a superficial cooling, which will permit the combination of certain elements and the production of solid or liquid particles, which, suspended in the still dissociated vapors, become intensely luminous and form the solar photosphere. The condensed particles, carried down into the intensely heated mass, again meet with a heat of dissociation, so that the process of combination at the surface is incessantly renewed, while the heat of the sun may be supposed to be maintained by the slow condensation of its mass; a diminution by 1-1000th of its present diameter being sufficient, according to Helmholtz, to maintain the present supply of heat for 21,000 years.

A REMARKABLE VEGETABLE PHENOMENA was recently communicated to the Paris Academy of Sciences by M. Lecoq, the result of some observations on a curious plant called Colocasia. This plant often exhibits a trembling or vibratory motion, without any apparent cause, and as many as 100 to 120 vibrations have been observed in a single minute. They are strong enough to affect the neighboring plants, and they have even caused a similar motion in the flower pots, one of which weighed 25 pounds. If true, this would appear to be a remarkable instance of the direct transmutation of solar heat and light into motion.

CHLOROFORM.—Experiments have proved that to preserve pure chloroform of specific gravity 1.49, it must be totally excluded from the light. To keep it in daylight, it must have its specific gravity reduced by the addition of two drachms of 95 per cent. alcohol to every avoirdupois pound.

THE PURIFICATION OF WATER—AN IMPORTANT SCIENTIFIC DISCOVERY.—The London Builder says that Mr. Thomas Spencer, the discoverer of electrotype, has made another important discovery. He has ascertained that the magnetic oxide of iron which abounds in rocky strata and in sands, etc., attracts oxygen, whether it exists in water or in air, and polarizes it—that this polarized oxygen is the salubrious ozone—that this ozone, so formed, destroys all discoloring and polluting organic solutions in water, and converts them into the sparkling and refreshing carbonic acid of the healthful spring. It is claimed that even sewerage water can be thus almost instantaneously purified. Moreover, Mr. Spencer has discovered that the apparently mechanical process of filtration is itself magetical, and it is now known that all substances are constitutionally more or less subject to magetical influence; thus all extraneous matters suspended in water may be rapidly attracted in filtration, and so separated; and this may be done whether on a great scale or a small, either by the magnetic oxide or black sand of iron, by a mixture of this with ordinary sand, or by various other means; and Mr. Spencer has discovered a solid porous combination of carbon with magnetic oxide, prepared from Cumberland hematite, which is said to have very great filtering power.

Mr. Booth, of Birmingham, England, has also recently promulgated a process for purifying water, for which meritorious claims are also put forth, and which may be very properly introduced in this connection. He places in the water a neutral solution of sulphate of alumina, in the proportion of one ounce to 435 gallons. The sulphuric acid of the sulphate decomposes the bicarbonate of lime in the water and forms an insoluble sulphate of lime instead. The hydrate of alumina being set free, forms with the organic matter in the water another insoluble compound. Both these fall to the bottom, and the remaining freed element, carbonic acid, lends an agreeable quality to the water.

CADMIUM IN THE ASSAY OFFICE.—According to M. Classen, silver is wholly precipitated by cadmium; when dealing with a nitric solution of silver, evaporate to dryness in the presence of sulphuric acid, dissolve the sulphate of silver in boiling water, plunge into it a plate of cadmium, and the reduction of silver takes place at once. The silver is deposited in a compact mass, easily washed with water; as it may contain a little cadmium, boil it in the acid liquid until no hydrogen escapes, wash it until the water contains no sulphuric acid, then dry and calcine. The silver at first a black grey, takes the metallic luster. It may then be weighed, the results are very exact.

NEW USE FOR ALUMINIUM BRONZE.—Mr. Hulot, director of the workshops where postage stamps are manufactured, at the Imperial Mint of France, having found that steel was rapidly deteriorated by gummed paper, substituted aluminium bronze with entire success. The 300 steel perforators used in piercing postage stamps became blunted after a few weeks of use, yet the new tool, containing perforators made of aluminium bronze at 30 per cent, has been striking 126,000 blows per day for several months past, and yet shows no sign of deterioration.

CLEANING GLASS.—A method of cleaning glass, which may answer when other methods fail, is to dilute the ordinary hydrofluoric acid, sold in gutta-percha bottles, with four or five parts of water; with this, wet a cotton rubber, and apply the rubber to the glass pretty thoroughly; afterward wash the glass until all traces of the acid are removed. The effect of this operation is to dissolve off a very thin portion of the glass, thus leaving a new and bright surface.

THE curvature of the earth amounts to seven inches per mile. A man six feet high cannot be seen from a distance of ten miles.

PUBLIC SCHOOLS TO BE INTRODUCED INTO RUSSIA.—The Emperor of Russia has taken an enlightened step. A system of instruction is to be organized over the length and breadth of the land. School houses are to be provided and teachers appointed at the expense of the government. The secular education will be taken entirely out of the hands of the priests.

BERRIES IN NEW YORK.—The herry train of New Jersey is an important element of wealth. One day, recently, more than a thousand bushels of whortleberries were forwarded to the New York market.

**NATURAL SOAP**, or soap clay, has been dug from Manpiu's mine, on the Burbois, in Franklin county, Missouri, some sixty miles from St. Louis. This soap, or clay, was found at a depth of seventy-five feet below the surface, which gives evidence of the presence of saponiferous qualities, and is equal in its effects to many of the soaps of the manufacturers.

We find the above in several of our exchanges. What has really been found is probably "fuller's earth," a variety of clay which, from its unctuous touch might easily be mistaken for "soap." The same kind of clay has been found on this coast, and heralded abroad as a "soap mine." "Fuller's earth" presents various shades of colors—yellowish, greenish, bluish, brown, and gray; its luster is dull, and it feels very soapy, when rubbed. The quality most preferred by those who use it, is that which, when put in water readily falls to pieces, with a slight cracking sound. Its composition is usually about as follows: Silica, 53; alumina, 10; peroxide of iron, 9.25; magnesia, 1.25; lime, 0.5; water, 24, with a trace of potash. It was formerly esteemed of much value, particularly by fullers; it is now, however, little esteemed or used, soap having taken its place by reason of its superiority, and recent great reduction in price. Soap, for many centuries after its discovery, was held at so high a price as to almost totally exclude it from common use, and from employment in large manufacturing establishments. Various vegetable and mineral substances, and alkaline and ammoniacal waters were used instead; the chief among these substances was fuller's earth, or "mineral soap," as above described.

Before modern chemistry, by reducing its cost, placed the useful article of soap within the reach of every one, fuller's earth was an article of almost indispensable necessity to a manufacturing community. It was considered of such great importance in England that its exportation was prohibited. It was found in large quantities in the counties of Surry and Buckingham, England, and transported from thence to all parts of the kingdom. When used, it was first dried in the sun or by fire, and then thrown into cold water, where it soon fell into a powder, which was sorted by washing into coarse and fine qualities, the former of which was used for inferior cloths, and the latter for fine goods. The article has no commercial value at this time.

**A STIMULANT TO INVENTORS.**—At the last meeting of the Mechanics' Institute in this city, a motion was made by Mr. J. H. Culver, that the society offer as a premium to inventors, \$500, suitably divided among the best three inventions that shall be perfected or patented in time to be placed on exhibition at the coming Fair of 1868. The above motion is to be acted upon at the next regular meeting of the society; and we trust the members of the Institute, after a careful consideration, will adopt it, as it cannot fail to become one of the most attractive features of the proposed exhibition. Every attempt that is made to bring out and develop the industry and genius of a country or section of country to enrich and elevate the people, not only benefits and ennobles the present generation, but all future generations will greatly profit by the example. If the ancient commonwealths had lent their aid and countenance to artisans and inventors, instead of making it a disgrace to become a worker of metals or a hewer of wood, the civilized world would not to-day be groping upon their hands and knees in the dust and ashes of buried cities, seeking in vain among the crumbling ruins or upon some time-stained utensil for some faint trace of secrets which have forever perished, and which all the skill and cunning of man, at this stage of enlightenment, has failed to discover. Suppose, for instance, that no aid or countenance had been lent to genius on this coast, and that inventors had languished for want of encouragement, and we had depended merely upon the East for our devices and machinery for extracting the precious metals, instead of the ring of the hammer upon the anvil, and the smoke and busv hum of a city as it is to-day, we should have been *Verba Buena* still.

### New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, new and important inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

#### PATENTS RECENTLY ISSUED.

The following patents have recently been issued to inventors on the Pacific coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, the claims of which have already appeared in our regular reports. We now subjoin brief descriptions:

66,546.—**IMPROVED METHOD OF REEFING TOPSAILS.**—Fridolf Höök, of San Francisco, Cal.

This invention, which consists of an improved method of reefing topsails from the decks of vessels, appears to be destined to work a revolution in the management of sailing vessels, and is the same, in substance, as the one mentioned some time since by the New York correspondent of the *Bulletin* of this city, and described as the invention of a poor California sailor. Mr. Höök is a Russian by birth, and sprung from a line of European inventors, his father having distinguished himself in Russia as an engineer and a man of great talent. Mr. Klinkofstrom, the Russian Consul of this city, is the agent for Mr. Höök.

67,427.—**MODE OF PRESERVING EGGS.**—P. Gaughran and L. Sweeney, San Francisco, Cal.

The idea upon which this invention is founded, is to exclude the air from the shell of the egg by a compound or preparation which forms a complete coating, and renders the shell impervious to air. By this means they claim that eggs may be kept an indefinite period, and still remain perfectly fresh and sweet.

67,581.—**IMPROVED GANG PLOW.**—Allen T. Covel, San Francisco, Cal.

This improved gang plow readily adapts itself to the inequalities of the ground to be plowed, with devices for raising, lowering and turning to and from the land. As it is said to possess many points of superiority, our farmers would do well to inquire into its merits.

67,935.—**STEAM GENERATOR.**—Charles O. Winegar, Drytown, Cal.

This invention consists of an improved steam generator, to take the place of the ordinary boiler, which consists of a series of longitudinal tubes or pipes, both ends of which are inserted in oblong water chests, placed transversely with the tubes, each series of tubes having independent chests, placed one above the other. The lower tier of tubes is composed of but one-half the number, and one-half the length of chest at the end, where the water is supplied to the generator, and terminates at the top in the same manner, giving an inclination to one half of the tubes alternately. A steam drum is placed upon the top of the uppermost tier, connected to the upper or short chest from which the steam is conducted to the engine. The chests are all pierced for plugs opposite the ends of each tube for the purpose of cleansing, which is accomplished by blowing the steam through them.

67,953.—**CLOTHES-WASHER.**—F. Ernst, San Francisco, Cal.

The nature of this invention consists in providing an apparatus by which clothes may be washed with very little handling or rubbing. The machine is composed of a copper cylinder, having a cover. Standing inside and upon the bottom of this cylinder, is a sieve or screen having legs. The clothes to be washed are placed upon this screen, having been previously well rubbed with soap, or other dirt dissolving substance, and covered with water, which is allowed to boil the usual time, when another movable screen or sieve is placed upon the top of the clothes, which serves to press the clothes down. After boiling, the water is drawn off by a cock at the bottom of the cylinder, below the lower sieve. The cock is large enough to discharge the water quite freely, which produces a water or air vacuum, and the water is forced through the fabric, carrying the dirt with it. Mr. A. P. Molitor, 611 Commercial street, is the agent for this invention.

66,012.—**IMPROVEMENT IN SIDE HILL PLOWS.**—Peter H. Flansburgh, Eden Township, California.

This invention relates to that class of plows, known as side hill plows; and has for its object an improvement in the mech-

anism, by which the plows are alternately engaged and disengaged as the plow goes across the field and back, raising one plow when the other is disengaged, and thus turning the furrows all in one direction. This is accomplished by constructing two plows, one right and the other left hand, both attached to the beam, and so placed that the land-sides may be parallel and close together, when both plows are on the ground in working order. The vertical racks or standards are fastened, one to each side of the beam. A segmental pinion works each of these racks or standards, each being operated by a lever independent of the other, so that both plows may be raised or lowered at the same time, or one raised and the other lowered. A hinge may be employed in place of the racks and pinions, to raise and lower the plows, and the same end be thereby attained.

66,046.—**IMPROVEMENT IN CUT-OFF VALVES.**—Irving M. Scott and Wm. R. Eckert, of San Francisco, Cal.

This invention is designed to provide an improved "Self-adjusting Cut-off," for stationary engines, so constructed as to admit of a side valve for admitting steam to and from the cylinder of a steam engine. This end is accomplished by constructing an engine in the ordinary manner, with a main valve, to admit the steam and discharge it from the cylinder. Upon the back of this valve, are two cut-off plates, having one opening in each. Through these plates, and parallel with the valve-face passes a rod, having cut upon it one right and one left-handed screw, working in corresponding nuts, which are fast to the cut-off plates or movable portions. This rod, if turned in one direction, moves the plates nearer together, and when turned in the opposite direction separates them. This screw receives its motion from the governor. The cut-off valves work on the back of the cut-off plates. This valve has a constant travel or throne. The motion of this valve is opposite or nearly opposite to that of the piston of the engine. The cutting off of the steam takes place by the cut-off valve coming in contact and passing over the outer edge of the cut-off plates. If the cut-off plates are moved close together, steam will be cut off sooner; if separated, it will be cut off later. The friction of the cut-off plate is entirely regulated by the engine.

68,257.—**IMPROVED APPARATUS FOR DISTILLING AND RECTIFYING PETROLEUM.**—Chas. Scott, San Francisco, Cal.

The object of this invention is to provide an improved apparatus for distilling and rectifying crude petroleum; the whole being accomplished at one operation, while the oil is much purer and has less smell than that rectified in the ordinary manner, by great heat and the use of acids. To effect this, a still or retort is provided in this invention, into which the crude oil is introduced; heat is then applied until the temperature is somewhat raised, but not to the boiling point. Steam is then let in through juts from a pipe, situated near the bottom of the still or retort, and the oil is thoroughly permeated by it, and is carried, in the form of a vapor, into a rectifier, where it is again subject to juts of steam from the tube near the bottom. This has the effect to thoroughly comminute the vapor, which rises till it strikes a refrigerating coil of pipe. This condenses and throws down the heavier portion, which passes off through the bottom of the rectifier into a worm, where it is still further condensed, and then runs back through a pipe into the retort or still, to be again subjected to the steam until all the most valuable portions have been extracted. The vapor which is not condensed by striking the first refrigerating oil, rises still farther when the next heaviest portion passes through a pipe into another refrigerating coil, from which the illuminating oil is drawn off. The lightest portion and the gases rise to the highest part, from which they are conducted by a pipe through a coil, and thus any considerable parts are saved.

**BEAN'S HISTORY OF NEVADA COUNTY.**—This book, which is also a complete directory for the county, has already been noticed in our columns. See advertisement in to-day's issue. Read the book for full information in regard to one of the most noted mining districts in the State.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

### AN INSTRUCTIVE BOOK!

Prof. LAYRES'

### ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY.

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

#### RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Sweet.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Deiman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*J. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest. It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Boole.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is as readable as the best of San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marysville Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, September 23, 1867.

Mining Share Market.

The mining share market has acquired a little more tone since our last reference, and most stocks show an advance over closing sales of last week.

HALE AND NORCROSS—has met with less favor, declining from \$1,025, seller 30, to \$800, seller 30, then selling at \$825, and \$900, seller 60.

SAVAGE—has been largely dealt in during the period under review at improved prices, opening at \$142.50, receding to \$134, rapidly advancing to \$168 in the open session on the 25th, then selling at \$150, and closing yesterday at \$154.

CHOLLAR-POROSS—is in better favor under considerable sales, selling at \$345@350 early in the week, declining to \$327.50, rapidly improving to \$355@370, and closing at \$379.

CROWN POINT—was in considerable request at greatly variable rates receding from \$770 to \$700, rising to \$780, falling to \$690, then selling at \$700@750, and closing at \$765.

receipts from the 1st to the 26th instant have been upwards of \$30,000.

KENTUCK—advanced from \$200 to \$213, receded to \$195, steadily improved to \$225, and closed yesterday at \$245.

IMPERIAL—changed hands at \$147.50@ \$144, then at \$151, and closed at \$147. The report of the Superintendent, of date the 21st, says that the Alta and Holmes mines are at present looking better than for some months past.

GOULD & CURRY—is in slight request at an advance, improving from \$310 to \$350 per foot, and at the close \$350 is bid.

YELLOW JACKET—has been less firm, advancing from \$475 to \$550, falling to \$440, then selling at \$475@450, and closing at \$500.

OVERMAN—has been inactive, selling at \$55@55, and closing at \$58. The bullion returns during the week amount to \$5,000. They extract about thirty tons of ore per day of all grades.

BELCHER—improved from \$92.50 to \$132, then sold at \$140. An assessment of \$15 per share was levied on the 21st inst. JUSTICE and INDEPENDENT receded from \$12 to \$6.50, rallied to \$11, and closed at \$9.

EMPIRE—sold at \$170@175. OPHIR declined from \$82 to \$79, and at the close sold at \$76. SIERRA NEVADA changed hands quite freely at \$6@5.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows: EL REFUGIO PETROLEUM Co.—San Francisco. Sept. 23d. Capital stock, \$1,250,000; 12,500 shares, \$100 each.

BELCHER MILL and MINING Co.—Calaveras county, Cal. Sept. 24th. Capital stock, \$25,000; 5,000 shares, \$5 each.

KONG CHOW BENEFICIAL SOCIETY and ASYLUM.—San Francisco. Sept. 25th. Officers: Wong Free Chi Good Chow, President; Eee Ah Kee, Secretary; and Chau Ah Luck, Teller, who are also Trustees.

An order was made in the County Court on the 25th inst., disincorporating the Empire Mining and Tunneling Co., according to the petition of the company.

THE EXPLORING EXPEDITION, under the conduct of Clarence King, was, at last accounts, at Unionville, Nevada. The expedition was progressing favorably.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location, Amount and Date of Assessment, Date of Meeting, Day of Delinquent Sale, and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DELINQUENT, OF SALE, DAY, DAY. Lists various mining companies like Ancient River, Cherokee Flat, Casala, etc.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

S. F. STOCK AND EXCHANGE BOARD.

Table with columns: MISCELLANEOUS STOCKS, Bid, Asked. Lists various bonds and stocks like United States 7-30th Bonds, Legal Tender Notes, etc.

GAS COMPANIES.

Table with columns: San Francisco Gas Co., Sacramento Gas Co., Bid, Asked.

RAILROADS.

Table with columns: Sacramento Valley Railroad, Salt Lake and San Jose Railroad, etc.

BANKING INSTITUTIONS.

Table with columns: California Loan and Savings Society, Bank of Pacific Accumulation Loan Society, etc.

INSURANCE COMPANIES.

Table with columns: Fireman's Fund Insurance Co., Pacific Insurance Co., etc.

MINING STOCKS—WASHOE DISTRICT.

Table with columns: Alpha, Belcher, Bullion, etc., Bid, Asked.

San Francisco Market Rates.

Table with columns: Flour, Extra, Superfine, Corn Meal, etc., Bid, Asked.

Table with columns: Hawaiian Rice, China Rice, Coal Oil, etc., Bid, Asked.

Retail Prices.

Table with columns: Butter, California, fresh, Eggs, etc., Bid, Asked.

San Francisco Metal Market.

PRICES FOR INVOICES. Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

Table with columns: Iron, Sheet, Pig, etc., Bid, Asked.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 28, 1867. We give the following as an approximate price at which copper ores can now be sold in this city.

Table with columns: 12 per cent, 13, 14, etc., Bid, Asked.

These prices, we believe, will be found substantially correct, and can be realized at this date.

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF AT 11 o'clock A. M. of the following dates, for PANAMA connecting with PANAMA Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK.

The following Steamships will be dispatched on dates as given below: September 10th—OLDEN CITY, Capt. W. F. Laidge.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines can be obtained at the office of the M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas.

OLIVER ELDRIDGE, Agent.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Sept. 21st: The I. X. L. mine is looking better at this time than at any previous period of its history. In the lower tunnel they have a vein of pay ore four feet thick, half of which is said to be first class.

The Tarshish lode is not measured yet, for though penetrated nearly at right angles over 85 ft., the west wall is not found. At the extreme point penetrated, they are finding ore of good quality both in pockets and in the quartz. The croppings indicate the presence of a larger body of ore ahead than that found near the east wall. Whether the main tunnel is now near it or not, a few weeks application of the development theory will determine.

Good progress is being made in Merrimac. The tunnel is completed, and they are running along side of the ledge.

The Rippon Co. owning the old Mammoth ground on the Mountain lode, at Silver Mountain, struck their ledge recently and are now breaking quartz. We have nothing definite as to the quality of the rock, and suppose they have not penetrated far enough to ascertain its character as an ore vein.

Two men working the Alpine tunnel are making a fine show this week, though the rock works not the best. They are still too close to the surface to expect good ore, though the real Tarshish sulphurets now and then show themselves so unmistakably that the owners work on with a will, convinced that the goal is near at hand.

## Amador County.

*Ledger*, Sept. 21st: The owners of the Union mine have contracted for sinking the old shaft 60 ft. deeper—making nearly 300 ft. in all. The ore is appearing favorable. The mill is undergoing repairs, and will start up in a few days.

The old Tullock mill has been leased and repaired by the Occidental Co., and is now at work on rock of their own and from the Anaconda mine.

## Calaveras County.

*Chronicle*, Sept. 21st: Messrs. Bowman & Priddle, who purchased the Depew mill and moved it from Spring Gulch, to their mill in Chili Gulch, are now nearly ready to commence operations. Their claim embraces a large extent of ground which has been prospected sufficiently to warrant them in going to the expense they have in opening it. When they commence taking out gravel and crushing, they will furnish employment to 30 men.

Mr. Shaw is "piping" away in his claim with good success, at least so far as tearing down the hill is concerned. He has not cleaned up yet, but when he does there is no doubt but the old Guy claim will give a first-rate account of itself.

Paul & Co., Brackett & Co., Allen & Co., Diacre & Co., and in fact all the boys engaged in mining throughout the entire length of the gulch are doing remarkable well.

## El Dorado County.

*Placerville Democrat*, Sept. 5th: One hundred feet of the U. S. Grant quartz lead No. 2, situated about seven miles east of this place on Brush Cañon, was sold recently for \$750. Earle & Co. have struck good prospects on the first extension south.

## Inyo County.

*Virginia Tresspass*, Sept. 21st: Henry Bush, Jr., writing from the Cerro Gordo mines, says he believes them to be very rich in mineral, and has refused a large sum of money for a fifth interest. Himself and company are building a house 20 by 30 ft., the timbers for which they are compelled to pack on their shoulders a distance of three miles; also, several furnaces, which will be in operation this month. In conclusion, Bush says all the mines on the mountain are rich—the richest he ever saw; plethoric with sulphurets, chloride, and native silver. He has seen at least 1,000 lbs. of bullion in the camp, most of which is worth \$1 per ounce.

*Virginia Enterprise*, Sept. 22d: Late accounts from Cerro Gordo Dist., Inyo county, California, are of a very flattering character. Some of our Virginians are engaged in building furnaces and we shall doubtless see some specimen bricks from their mines ere long.

## Kern County.

*Visalia Delta*, Sept. 18th: The Havilab correspondent writes that out of the eight or ten quartz mills within a mile of that town, with a crushing capacity of 250 tons per day, but three or four are running. Mr. McKidney has a fine 8-stamp mill, with two Wheeler pans for working silver ore, and two of the Betb grinders for gold rock; two

large roasting furnaces, and several sulphuret machines. He intends working in a short time by chlorination. He is raising from the Delphi mine, some of the richest ore we have seen for many months, and have a large body of equally good rock in sight.

Marsh & Kennedy have one of the best 8-stamp mills in the country. It contains some decided improvements, which, we believe, have been patented by him. The greatest improvement is in the cam, there being two cam-cast upon each hub, allowing the lift to come between one and two, and three and four, reversing the motion of the stamps, causing the pulp to distribute more evenly in the mortar, besides the additional advantage of giving more room to work round the cam shaft, should anything get out of order; the other consists of an extra and peculiarly shaped recess being cast in the back of the mortar for the reception of copper plate, thereby saving from one to two hours time in cleaning up, besides being in a much better position for gathering the gold than on the front in the old style.

In the second or bottom level of the Joe Walker mine, there is a vein of ore from 10 to 12 ft. thick, all pay ore, yielding on an average, with a plain battery, \$35 per ton.

In the El Dorado Dist. the ledges are large and well defined, ranging from two to five feet, and are exceedingly rich, so far as have been tested. If we may judge from the small batches of ore worked from 10 or 12 different mines in this new district, we can safely predict that it will be the richest mining locality on the coast.

## Los Angeles County.

*News*, Sept. 17th: Last week, some parties who were prospecting in San Francisco Cañon, about 40 miles north of this city, struck a rich streak of pay dirt about half a mile or so above Seales & Yates' store. The dirt prospected from six cents to \$1 to the pan near the bedrock. On each side of this cañon are extensive placer mines—Casteca and San Feliciano—which are worked every winter as long as there is water to wash the dirt, and the miners make fair wages. The Seales Brothers intend this winter to put in a bedrock flume in the center of the cañon, and from prospects obtained they are confident of success.

The Los Angeles correspondent to the *Atta* of Sept. 23d, says: There have been some most flattering discoveries of silver ore made within the past few days on the San Gabriel river, on the Zapato vein. The owners of the Zapato mine have expended much labor and considerable capital for some years past in their efforts to open their mine. To the present time they have failed to strike a paying lode or vein. From the statements made to me the prospect is encouraging that the true lode has been struck. I have not seen any of the ore, but it is described to me as being very rich and abundant.

## Mono County.

*Sonora Herald*, Sept. 14th: The Empire Co. at Brodie, expect to resume operations soon. Also, the Lady Alice Co. Mooney & Walker, Kernohan & Co. and others are working their claims successfully, the rock averaging from \$15 to \$25 per ton, and is crushed by water mills on Rough Creek, about two miles from the mines. At the Blind Springs and Montgomery Dists., a great quantity of fine ore is being taken out for shipment to San Francisco. Williams & Co. are working the Diana successfully by means of a 4-stamp mill, with pans. A lode has been discovered between Big Towu and Mouoville, near Castle Peak, Mono county, which proves to be very rich. Snyder & Co. are the fortunate discoverers.

## Nevada County.

*Transcript*, Sept. 20th: The claims located on the old Yuha river channel, in the vicinity of Washington, are paying first-rate. Recently, Battis & Co. struck a splendid bed of gravel, which is 3 ft. deep, and prospects splendidly from top to bed-rock. The incline is down about 40 ft., and the main tunnel is opened some 20 ft. It is said to be one of the richest claims yet opened upon the river bed. At Rocky Bar, all the companies are making lots of money. On Tuesday last, the lower company, Root & Co., took out gravel which paid over 9 ozs. to the pan.

Sept. 22d: A number of Chinese have put up sluice boxes, and are engaged in mining out the tailings at the mouth of Lost Ravine.

The Grizzly mine, after a run of 12 days, yielded \$1,200. The mill has only 5 stamps, but it is the purpose of the company to put up 5 more before winter. The machinery is already upon the ground. The ledge is large, and sufficient rock can be taken out to keep 10 stamps in operation day and night.

The Birchville C. M. Co., at Eureka,

after the last run, cleaned up \$40 to the ton. For several crushings this mine has yielded an average of from \$30 to \$40 to the ton.

The Commercial is an excellent 10-stamp mill recently erected near Eureka by San Francisco parties, for the purpose of crushing rock from their mine. The Commercial is said to be a first-rate mill. It commenced work last week.

Some parties are engaged in saving the tailings which come from Stiles' mill. The sand coming from the mill is caught in vats, and then run through sluices, over blankets, upon shaking troughs, where the sand is washed off and the sulphurets retained to be worked by the chlorine process.

*Gazette*, Sept. 19th: J. J. Collins, of You Bet, has just struck pay ground in his cement diggings. He has a 10-stamp mill. Heydliff's mill, Mallory's mill, and the Neece & West mill, are all running on cement, and said to be paying their owners dividends.

Sept. 24th: A quartz ledge was discovered at Selby Flat, on Friday last, 2½ in. wide. One pan full of the rock, crushed in a mortar, yielded \$6. At the depth of eight ft., the ledge maintains the same width and the same appearance of richness as at the surface.

Sept. 25th: Mr. Skookam and a colored man called "Jake," discovered a large quartz ledge some time last week about one-fourth of a mile from Eureka. The vein is twelve feet wide at the surface and shows considerable free gold. The discovery is considered to be one of the most valuable in the district. Sam. Hartley has recently struck the extension to the Birchville ledge, two miles from Eureka, on the North Fork of Poorman's creek.

*Excelsior*—Meadow Lake *Sun*, Sept. 21st: The Mohawk and Montreal mine never looked better than at present. The editor lately visited the mill of the company, and found the plates literally covered with splendid looking amalgam.

The Gold Run mine is being rapidly developed. The tunnel has been driven 260 ft. along the line of the ledge, and the ore of the mine is looking well. In a month or two the company owning this claim can make as good a showing as far as a well developed and well defined quartz lode is concerned as any one in the district. We were shown a day or two ago some splendid looking rock from this mine which assays very well.

A few days since a beautiful specimen of ore from the Eclipse Co's claim, was laid on our table. In appearance it resembles very much the celebrated Black Rock ore, of which so much has been said. Fine gold is discernible in all parts of the specimens shown us, and they have a body of ore two feet in width, equal in richness to the specimens. They have taken out about 30 tons of excellent ore.

The owners of the Comet and Camp Co's claims, are working away developing their mines which promise well for the future. A few days ago a fine body of ore was struck in the Comet.

The Kentucky Co. have a force of men engaged in selecting and sacking ore preparatory to sending it to the Ossaville mill for reduction.

## Placer County.

*Auburn Stars and Stripes*, Sept. 18th: The Green Emigrant Co. have made another rich strike on their claim, at a distance of several hundred feet from any previous strike. Seams of auriferous talcose slate, apparently alive with gold, have been found, with every indication of being continuous, in the hard quartz that forms the hump on top of the hill.

*Herald*, Sept. 21st: McGonigle & Co. have struck rich prospects in their claim, on the Black ledge. The ledge is seven ft. wide, yielding as high as 50 cts. to the pan.

*Dutch Flat Enquirer*, Sept. 21st: The American Eagle Mining Co. are digging a tunnel 1,144 feet long, for Hall & Allen's ditch.

The *Atta* says it is reported that the Paragon cement mine, at Bath, Placer county, has been sold to a San Francisco company for \$150,000.

*Marysville Appeal*, Sept. 25th: The Green Emigrant claim, near Auburn, has been opened in a new place all alive with gold. This is hundreds of feet from the former openings.

The Lincoln correspondent of the *S. F. Bulletin*, writes Sept. 23d: The Valley View Quartz is regarded by all as very valuable. A mill of 40 stamps has been paying dividends on it right along. It is now sold to an English company in London. Crosby & Manter have a mill adjoining the large one which works five stamps and two arastras. It is surmised by those that know, that the rock of the small mill is by odds the richest. Nickerson, Cadwalader & Hub-

hard have nearly completed a third mill in the same locality, of 24 stamps.

## Plumas County.

The Nelson Point correspondent of the *Marysville Appeal* of Sept. 24th writes: Lee & Co., in Nelson creek, have been "stripping" for the last three weeks. They expect to find solid dirt. Jolly & Co. have finished cleaning up, having made a good run. They are now putting in new gold-flumes, expecting to make even better pay this next spring. Hardy is sweeping off surface by the acre; can't tell exactly what he is making, but guess wages.

*Quincy National*, Sept. 21st: All the quartz mills near Taylorville are running except the Crescent Mills, and it is said they will start in a short time.

## Shasta County.

*Courier*, Sept. 21st: The editor states that stockholders in the South Fork ledge have received information that persons who have heretofore pretended to aid in securing the sale of or development of those ledges have been "throwing off," and in reality doing all they could to injure the reputation of the mines.

A few days ago we were shown a splendid specimen from the Washington mine at French Gulch, taken from a lode 20 in. thick and 300 ft. from the surface. The prospects of this mine were never better than at present.

## Sierra County.

*Downieville Messenger*, Sept. 12th: One of the large hydraulics of the American Co. at Morristown blew down last Tuesday night, breaking the pipe and throwing it to the ground.

The New York Co., of Sawpit Flat, suffered, on the night of the 11th, the loss of their dump house and other outbuildings by fire.

## COLORADO.

*Georgetown Miner*, Sept. 5th: Reduction works on an extensive scale will be erected here during the coming fall and winter.

A small quantity of ore from the Malahar lode, Peru Dist., has been brought over to the smelting works for reduction.

Work on the Wentworth lode, Columbia Mountain, is progressing finely. A large body of sulphurets has been disclosed by recent operations.

On Monday last a hock of pure silver bearing galena, the weight of which is estimated at 1,500 lbs., was raised from the New Boston lode.

The Muscovite Co. have recently sold to the Georgetown Silver Smelting Co., a large amount of galena ore, delivered at the mouth of the shaft.

The New Philadelphia lode, on Douglas Mountain, is now turning out some very fine ore. The work upon this valuable property is being actively prosecuted.

Ore from the Belmont lode, at Argentine, is now being delivered at Garrott, Martine & Co's works for reduction. A large yield is expected from the ore.

A beautiful piece of silver bullion weighing 24 ozs., was taken from six pounds of ore from the Wm. B. Astor lode lately. The coin value of the bullion is \$32.40. The ore was selected first class, and shows \$10,800 per ton.

The California Reduction Works, from 15 tons second quality ore from the Smith & Parmelee mine, obtained 47½ ozs. of bullion, valued at \$851.16, which is upwards of \$77 per ton.

On Monday last we saw a beautiful bar of silver bullion, weighing 7 ozs. 17 dwt. .998 fine, taken from 20 lbs. of ore from the North American lode. The coin value of the bar is \$10.20 at the rate of \$1,020 per ton.

The *Denver News* says that during the past month (Aug.) Warren, Hussey & Co. have shipped over 1,500 ozs. of gold, over \$30,000.

*Register*, Sept. 13th: Capt. S. N. Hoyt is mining very successfully in Granite district, Lake Co. He is running two Mexican arastras by mule power, which pay about \$100 per day. The ore is from six different lodes, and is not sorted. The yield from selected ores in the arastras would of course be much larger. These arastras are the first reduction works ever run in Lake county. The crevices arcaise from one and a half to six feet in width. Some pyrites is found near the surface, but on going down it entirely disappears, the crevices widen and the material in them becomes softer and richer.

## IDAHO.

The Walla Walla *Statesman* says that the discovery of the new mines about 340 miles from that place, have created an intense excitement, and says: The party of 12 men who went out early in the season to prospect the Big Bend of the Kootenai, has struck it rich, and report the whole strip of country from Kootenai river to the Pen d'Oreille abounding in gold. They were

endeavoring to keep the discovery as quiet as possible, until such time as they would be able to notify their friends and secure them in possession of the best claims. The news, however, has leaked out, and already parties are on their way to the new diggings. The claims on Finloy Creek have paid well this season, and miners who desired to leave for the new discovery have sold their claims as high as \$1,800.

Lewiston Journal, Sept. 5th: Sanderson & Co. at Warren's diggings, have made important improvements in their quartz mill, and at the second trial it proved a complete success. Some ladies broke a bottle of champagne over the wheel, and christened the mill the "Alpha."

Williams & Maxwell already have their mill building raised.

Some ladies washed a single pan of rock from the "Alpha" mill, which yielded \$7.60.

Owyhee Advertiser, Sept. 14th: New placer diggings have been discovered on the headwaters of the Payotte river, and there is quite a rush to that locality.

There is now a great excitement on the Oro Fino Mountain, caused by the discovery of a rich ledge, claimed by three different parties under as many different names. The ledge bears evidence of being immensely rich—from \$5 to \$20 to the pan being frequently obtained from dirt and decomposed quartz in the immediate vicinity of the ledge. We saw ore that was taken from the vein near the surface where Fogus is sinking a shaft with fine gold visible to the naked eye all over it. The mine is now engaged in crushing the ore from the Ida Elmore.

The Owyhee Co. is making extensive improvements. Their smelting and retorting works have recently been improved and enlarged—six new pans have been added to the mill.

The ledge in the Oro Fino becomes wider and better as it increases in depth, and at present richer ore than was ever before known in the mine is being taken out, some of it having the appearance of having come in contact with a shower of molten gold, that had spattered over and penetrated it throughout. Preparations are being made to run the mine and mill all winter.

J. C. Ainsworth, one of the principal owners in the Surplus Oro Fino ledge, has bonded the Surplus for one year to Messrs. Walbridge, Colo and Crane. Laborers have already been engaged, and from inquiry we learn that there is an excellent prospect with a little more labor of finding a body of ore equal to the present rich stuff coming from the Oro Fino. The last ore obtained from the shaft was worth \$25 per ton.

**MONTANA.**

Montana Post, Sept. 14th: The Montana Flaming Co., below Junction City, have 10 men employed. They have 1,600 ft. of flume constructed, 3 ft. high and 3 ft. wide. They will strike bed-rock in 400 ft. more, when they expect to take out about \$300 a day.

The Mapleton quartz mill on Granite gulch is now idle, awaiting the construction of machinery for the saving of silver, the lead, at a depth of 65 ft., becoming rich in that metal.

Ben. Williams & Co. have in successful operation a neat flume, about 1,000 ft. long, which brings them within 2 ft. of bed-rock. It is understood they are doing very well. The next is a flume beginning on German Bar, and extending up the gulch a distance of 5,200 ft., reaching Nugget Bar. Most of the flume is laid through ground at a depth of 18 ft.

The California Co. have a good flume about 1,200 ft. long, leading to their ground on the famous Word's Bar. When water becomes plenty, they will be enabled to sluice off a large amount of ground, from which they will reap a rich reward for their energy and perseverance. Blake & Co. are progressing rapidly with their flume, and have made several good clean ups.

The last clean up of the Union City mill produced 177½ ozs. of bullion; currency value, \$4,312.50, making two very nice bricks. The mill has been principally employed on custom work for the past few weeks. The workmen are busily employed on the Grant tunnel, and it is expected daily to tap the lead.

**NEVADA.**

Enterprise, Sept. 20th: Upon the strength of the late results, many of our prospectors are turning their faces toward Black Rock. A lot of five tons of ore from the same region is now being worked in Gold Hill. The amalgamation in one pan will be superintended by Mr. Isenbeck, who so successfully worked on the ore at Dall's mill, while in the second it will be done according to the process common in the mill in which it is worked. Should the mines prove as rich as is supposed, it is said that the known

leads of the district would furnish sufficient ore to run all the mills in the State for a thousand years without digging in any one place to a depth exceeding 1,000 ft. Mr. Isenbeck and other mineralogists confidently assert that when the leads of the district have been followed down until the water level is attained, the present chlorides, bromides and iodides will be found to have changed to black sulphuret ore.

Trespass, Sept. 24th: This morning Mr. Charles Isenbeck laid upon our table for inspection 13 bars of bullion, the proceeds of 13 different quantities of ore from 13 mines in the Black Rock country, the yields from which were—the lowest \$128, the highest \$370 per ton, gold predominating. The ore was worked at Dall's mill, by mill and pan process, and in Varney pans, and establishes the fact almost beyond cavil, that there is no difficulty in obtaining rich returns from Black Rock ore. Another quantity of ore from the Snow Storm and Silver Star ledges is now in process of reduction at Stephenson's mill in Gold Hill, where all who are skeptical in the premises can go and be assured by seeing the working.

**REESE RIVER.**

Reveille, Sept. 16th: The Ophir mine in Manhattan Dist. shows considerable mineral, as far as explored, and several strata occur in the body of the vein, which carry very fine ore.

Towards the foothills which jut into Smoky Valley is a huge ledge, called the McMurray, which crops out holdly. The ore procured from the surface, as well as from the deepest excavations, assays largely both in gold and silver. Besides these ledges there are several others which appear to be highly metalliferous.

Some 4,200 ozs. of crude bullion were brought in from Cortez by Russell's stage on Saturday evening, and delivered at the assay office of the Keystone mill for melting and assay. It was produced from ore obtained from the St. Louis mine.

Sept. 17th: The mill of the Old Dominion Co. has been completed and set in motion, with a good supply of ore on hand. The company expect, before long, to supply sufficient ore from its own mines to run the mill. The prospects of Hot Creek are of the most encouraging character.

The Long Island mill, of 5 stamps, is being put in order for the reduction of ore by the Supt. of the Timoke property. The work is to be done and the mill set in motion as speedily as possible.

The 5-stamp mill, known as the Ware mill, is to be taken down and removed to New Pass, where it will be put up for the reduction of gold quartz.

Sept. 20th: Last evening there arrived in Russell's stage from Cortez 5,838 ozs. of crude bullion from the mill of the Mount Tenaho Co. It is the product of ore from the St. Louis mine.

It is doubtful whether the mill of the Centenary Co., in Newark Dist., will do much this season, owing to delay in fitting it for crushing.

Some 3,000 ozs. of crude bullion arrived this morning on the stage. It came from the mill of the Social and Steptoe Co. at Egan Cañon.

By the Austin stage, yesterday, two bars of bullion were brought from the mill of the Belmont Co.

Sept. 21st: The Old Dominion mine in the district of Hot Creek is producing ore of the finest quality. Perhaps the best samples of horn silver which have yet been procured in any of the districts southeast of Austin are now produced by that mine. We were shown yesterday a massive piece of the beautiful ore, which one could indent easily with the finger nail. A person who saw the mine a few days ago says that great quantities of this pure chloride were being developed and extracted, and it was estimated that lots of it would yield in the mill from \$1,000 to \$3,000 per ton.

Of the ores sent to the Paris Exposition from Reese River, and assayed at the School of Mines in Paris, the greatest yield was from ore from the Timoke mine on Lander Hill. The assay exceeded \$6,000 per ton.

The Rigby mill will soon be repaired and running. The mill will be supplied from the Liberty mine, where there is at present a good lot of excellent ore ready for use.

The editor has visited the property of the Vedder Silver Mining Co., near Austin, and gives quite a lengthy description of their ledges. He says the Vedder was opened by an incline 120 ft., which shows a vein of ore 2 to 3 ft. thick. From the incline ore was taken which produced upwards of \$300 per ton, and some choice selections made which went over \$2,000 per ton. The mine in its first opening gave good promise, and there are certainly good grounds for expecting it to prove valuable at the point

where a few weeks, perhaps a few days, more labor will pierce it.

Trespass, Sept. 19th: The following is the returns, brought by Mr. Henry Donnell, of the working of different ledges in Washington Dist. The ore was worked by Mr. Isenbeck at Dall's mill: The ore from a series of eight ledges returned per ton \$107, of which \$90 was in gold and \$17 in silver. The Highbridge, \$65; in gold, \$40; silver, \$25. The Poughkeepsie, \$40 in gold. These returns are actual, and very flattering, when it is remembered that several assayers have pronounced them void of either gold or silver. Mr. Donnell and his associates will at once proceed to the district and commence active prospecting on the various ledges. In a few months it is proposed to erect a mill, at which the ores will be treated by Mr. Isenbeck's process, which, it is believed, is the only process yet discovered by workers of minerals.

Silver Bend Reporter, Sept. 21st: For the past week the mill of the Belmont Co. has been running with its new machinery, and turning out lots of bullion. The new improvements are: a new hoiler, three of Belding's pans, two Belding settlers, new cam shaft, tappets, etc. The battery has also been overhauled thoroughly, and everything now moves like clock-work. At present the mill is crushing and amalgamating about 10 tons of ore daily.

Enterprise, Sept. 24th: We yesterday saw at the office of Dr. McMeans some very fine looking ore from the Lawson & McMeans. It was taken from the vein at a depth of 25 feet. In appearance it is decidedly superior to any ore we have yet seen from the mine. Ores taken out above and much inferior in looks have assayed from \$40 to over \$100. Specimens of the rock last struck are now in the assayer's hands.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Sept. 18th: A boiler weighing 9,000 lbs., passed through this city yesterday morning for the Empire State mill.

Sept. 20th: The Sierra Nevada Co. are steadily drifting for their lead, having cleared the old tunnels of the mud which had accumulated in them during the time the mine was flooded. The mine is kept drained by working the pump one hour per day.

Sept. 21st: Steele & Co. are still engaged in extracting ore from the Sacramento mine, Cedar Hill. They have but a small force of men at work, but are making very good wages.

Parties are now engaged in getting out ore on the old Chollar croppings. We understand that they will take out 100 tons as a test crushing.

The total amount of bullion shipped during the past week from Wells, Fargo & Co's offices in this city and Gold Hill was 6,739 lbs., valued at \$143,519.67. The total number of ounces received for assay during the week at the various offices in this city and Gold Hill was 76,219.

Sept. 22d: A force of men have commenced work on the Coryell mine, situated just north of the Overman works. The shaft, which is 185 ft. in depth, has been thoroughly timbered where timbers were required, and a drift for the old Mary Ann chimney is now being rapidly pushed ahead.

The Eclipse mill at Gold Hill has resumed crushing ore from the mine of the company. A reserve of over 1,000 tons has accumulated.

**OREGON.**

Dalles Mountaineer, Sept. 7th: We have received very flattering information from a gentleman who was an eye witness to the last clean up at the Col. Ruckel mill. After a run of nine days, crushing about 100 tons of quartz, it netted the nice little sum of \$9,000 of the finest quality of amalgam that mortal eyes ever looked upon. The lode has now widened out to five feet, and the future prospects are more flattering than ever.

Jacksonville Sentinel, Sept. 3d: Mr. Mosher, of Roseburg, was in town the other day with some rich specimens of silver-bearing quartz, taken from a ledge on Coast Fork, within a few miles of the Bohemia mine. We understand that one of the discoverers has taken a quantity of the rock to San Francisco to have it assayed.

The Portland Herald says that a fine quality of limestone has been discovered on Butte Creek, Clackamas county, so that beyond doubt Oregon lime will soon be another "home made" production.

Salem Record, Sept. 18th: Mr. Salmon and his party who have been prospecting in the Santiam mines, have carefully worked 40 tons of refuse ore that had been run through sluices to wash off the decayed portions, and sulphurets found in veins through the mine, and have saved \$4 per

ton, nearly twice the cost of reduction. This ore was deemed worthless, and the owners are sanguine that the ores will yield over \$10 per ton.

Good iron ore has been found at Knox's Butte, Linn county. It resembles the red hematite ore found at Oswego.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. W. D. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Sept. 28, 1867.

## Notices to Correspondents.

**VIATOR.**—The Great Geyser, in Iceland, will probably at some distant day, cease to give forth its customary boiling and intermitting jets. This opinion is based upon the fact, that the enclosing tube is slowly lengthening by the deposition of silica, and will eventually become so elongated that the pressure of the liquid column, thus growing gradually longer, will at last prevent the subterranean waters from being converted into vapor, the elasticity of which causes the existing phenomena. Many scenes observed in Iceland, indicate that a fate of this kind has befallen many previous springs of a similar character. Thus, mounds are observed perforated by shafts, evidently at one time acted upon by thermal waters, but now filled with debris, the waters and vapors having escaped through other channels, presenting a less degree of resistance.

**OPTICS.**—Color blindness, as it is somewhat inappropriately termed, is by no means uncommon. This visual defect was originally called DALTONISM, in consequence of John Dalton, the English chemist, being a victim of this imperfection of the visual organs, and to whom also is generally attributed the discovery of this singular malady, for which we are not aware that any cure or palliative has been suggested. With Dalton crimson appeared of a muddy blue by daylight, and a stick of red sealing wax appeared the color of grass. Dark green woolen cloth appeared muddy, or brick red, and a florid complexioned bacchanalian appeared to possess a dusky blue countenance. Thus a thorough Bardoian rose, in place of reminding a Falstaff of "hell fire," would present that of a thorough "Blue-rose."

**ONE INTERESTED.**—The richest silver mining district in Europe at the present day, is in the Austrian dominions, viz., at Przibram in Bohemia. Some of the ores obtained at that place are remarkable, one vein in particular being composed almost wholly of ruby silver ores; some of the zinciferous ores in this vicinity, are also remarkable as containing a very large percentage of cadmium, as compared with the blends of other parts of the world. The depth to which some of the mines at Przibram are now worked, in some instances is more than 1,300 feet, with no appearance of giving out.

**ARCHITECT.**—The three largest stone arches in the world, are as follows: The Grosvenor bridge which spans the Dee at Chester, England, with a single arch of two hundred feet in length. The next in size is a very ancient one, erected by Grenier, in the year 1454, at Vielle Briode, in France, whose span is one hundred and eighty-three feet; it crosses the river Allien. The next largest is the Central arch, of London bridge, whose span is one hundred and fifty-two feet six inches.

**CHEMISTS.**—On the authority of Berthier, Berzelius and others, we may state that gold can be combined with sulphur, and so form a sulphuret; in fact the last named chemist describes two varieties, viz.: a protosulphide, in addition to the more generally recognized tersulphide, which is represented as being composed as follows: Au 199 + 3S 48 = Au S' 247.

## A National Mining College.

Within the brief space of eighteen years, our people have opened up to settlement a larger area of territory, valuable as a source of supply for nearly all the necessities of man, than has ever before in the world's history been brought within the limits of civilization, in so short a time. Eighteen years ago California, Arizona, Colorado, Montana, Idaho, Washington Territory, Oregon, Utah, and Nevada—occupying more than one-third of the entire area of the United States—were regions chiefly known to trappers and traders; traversed and occupied for the most part by barbarous hordes of Indians. That this extraordinary advance, with all its concomitant results to the trade and commerce of the world, has been achieved by the discovery and development of our mineral resources, no reasonable man pretends to dispute. Every day's progress in our history speaks for itself, and the facts are patent to all.

It seems a little singular, considering the millions of treasure thus added to our national wealth, the vast range of industry opened to our people, the wonderful impulse given to agriculture, commerce and manufactures—that of all our great national interests, the business of mining has had the hardest struggle to enlist the favorable consideration of our government. Of late years, through the energy and ability of our Pacific delegation, and the irresistible logic of results, something has been achieved in the way of more intelligent Federal legislation.

The Mineral Land Law of August, 1866, granting titles in fee to the miners, is an advance in the right direction. The appropriation for the collection of mining statistics, is another.

There is something yet to be done quite as important, in our estimation, as either; and we are glad to know that Mr. Commissioner Browne has, after consultation with the people throughout the principal mining districts, taken the matter zealously in hand, and determined to urge upon Congress in his forthcoming report, the importance of establishing a National Mining School, similar in its general features to the great mining schools of Germany, France and England. In the preliminary consideration of the subject, it matters little about details as to the organization of the plan. There will naturally be points upon which the best judgments may differ; but we think all will concur in the opinion that such an institution, established upon a broad and liberal basis, would be of incalculable advantage to the Pacific coast, and incidentally to every State in the Union. There is more lost to the country, even now, far as we have progressed in the science of mining, than would pay the expenses of a National Mining College ten times over. Why should we be compelled to send our young men to Freiberg to study a pursuit in which we are more deeply interested than any other people? The State Agricultural and Mining School will be an institution of great utility, eminently worthy of encouragement. But we want something in addition to this; something of a more national character—an institution of the highest grade; one worthy the richest mineral region in the world, peopled by an intelligent and progressive race, and comprising at least eight of the most promising States and Territories of the Union.

We have heretofore, in noticing the yield of Australian gold mines, called attention to the fact that although the official tables show a loss of fully one-third of the total assay value of the rock, the millmen appear to be very indifferent to the subject; more so, if possible, than in California. A recent report on the St. Juan del Rey mine, in Brazil, congratulates the stockholders upon the gratifying fact that their loss is now only 30 per cent., instead of 50 or 60, as it has ranged in former years. This would

seem incredible, if we did not know that with all the improvements in the treatment of ores, adopted from time to time by our own miners, there is still lost in tailings and otherwise, from 20 to 25 per cent., if not more, on our annual product. It becomes, therefore, a matter of vital importance that every possible means should be taken to arrest this tremendous drain upon our resources. And the question arises, what better means can be adopted than the establishment of a great National School, in which all the resources of science and practical experience can be brought to bear upon the essential processes of reduction, concentration and amalgamation.

## Fourteenth Annual State Fair.

(Continued from last week.)

**American Steel.**—Wm. H. Daffis of this city, exhibited a lot of American steel from the Philadelphia Steel Works, with a turning tool which had been made from the same, and subjected to a most severe test, at the Union Foundry. This tool held run quite across the surface of a 5-foot locomotive driving wheel, with 5-inch face, including flange. It appeared fully able to do even more work still, without sharpening. This is perhaps the best test to which steel can be put. A tool, made from the best English steel, could not be able to stand half the work or (what is also a great advantage) be able to do it in anything like so short a time. A piece was cut from this steel by the Committee, and thoroughly tested in the fire. They pronounced it superior to any English imported, and recommended it to general use, as a superior article of American manufacture. A first premium was awarded to it as the best steel exhibited, and a special premium and diploma for the general display of steel, and steel tools.

**Shingle Machine.**—F. A. Huntington, of this city, exhibited a shingle sawing machine, an improvement of recent date. One of its features is that the block to be cut from stands on end instead of lying flat, thus saving in the space the saw has to travel. Its capacity is about 30,000 in twelve hours. A sample of the shingles of the French style, to make fancy roofs, was also shown. The operation of this machine drew large numbers of spectators. These machines are built by George T. Tracy, machinist, at 109 Mission street in this city. The first premium for shingle machines was awarded to it, with a recommendation for its rapidity of work and the perfection of its operations.

**Miller's Adjustable Saw Teeth.**—Joseph Stone, of this city, (sole agent) exhibited a 62-inch circular saw, with Miller's adjustable teeth. The main advantage claimed for this tooth is the peculiarity of its leverage, by which the space for the sawdust is within the rim of the saw, while in all others it is outside; a thinner plate can also be used. It is claimed by the agent, that this same saw saves five per cent of the lumber, and fifty per cent of the motive power. One tooth, it is said, will last longer than five of the ordinary teeth, and a tooth can be taken out and replaced, when desired, in half a minute. The same is easily kept in order.

**California Wood.**—Mr. John D. Boyd, the well known wood polisher of this city, made a fine exhibition of his important and exquisitely finished wood work, which attracted most marked attention. Mr. Boyd is the pioneer in this business, and has done more than all other men combined to show the value and superiority of California woods for ornamental work. It is gratifying that he is at last meeting with that success which his efforts so richly merit. He has already received two extensive orders from the East. His work at the Paris Exposition has been pronounced superior to any thing of the kind in that grand competitive exhibition of the world's skill, in this direction. The field for enterprise and industry in this business is almost unlimited, and California veneers will eventually form an important item in our annual exports, in addition to the home consumption. Mr. Boyd gave a practical exhibition of the interesting process of wood polishing at the Pavilion.

**Walt's Salad Bowl.**—One of the most attractive items in Mr. Boyd's exhibit, was a beautifully finished salad bowl, made by him, for Hon. William Walt, of Grass Valley. This bowl is 16 inches in diameter, beautifully carved and polished, resting upon four legs, each representing a Scotch thistle, while the handles are formed of lion's heads engraved in bold relief. It constitutes a really elegant specimen of polished wood and carving, and will form a most worthy and useful ornament for the generous and hospitable table for which it

is intended. Mr. Boyd was awarded for his display a special first premium.

**Furniture.**—M. P. Cole, of this city, made a very fine exhibition of superb furniture. An elegant parlor set of silver gray courtelaine attracted great attention for the beauty and uniqueness of its design and the richness of the material. A most noticeable feature connected with it was the fact that it was made of California rosewood, which was all in the log only seven weeks before it was placed on exhibition! The set was valued at \$500. Mr. Cole also exhibited a parlor set in green, with sample chairs of unique design; also, a marble-top chamber set valued at \$400. Mr. Cole received three especial premiums.

Messrs. Goodwin & Co., exhibited a parlor set of rich hrocattelle, a library and dining-room set; a leather adjustable reclining chair, also a Turkish chair, with elegant and unique upholstery, the latter made entirely in San Francisco, with the exception of the hrocattelle which was imported; the elegant gold fringe was made by Mrs. Norcross. The chair is valued at \$150, and is the most expensive chair in the State—the next most costly is occupied by Mrs. Gov. Stanford, of Sacramento, and was also made by Mr. Goodwin, at a cost of \$125. Their collection was very fine, and took six first premiums for as many different classes exhibited.

The Boston Furniture Company, of this city, exhibited a fine chamber set in black walnut, and a rosewood and gilt parlor set, covered with crimson and silk reps; also, a spring bed of superior quality, and hair mattresses.

**Pianos.**—Messrs Kohler, Chase & Co., of this city, and Mr. L. H. Hammer, of Sacramento, made a very fine exhibit of pianos. They had a large-sized Mason & Hamlin organ, with pipe front and double bank of keys, together with Chickering & Son's concert, grand square, and parlor square pianos, forming as fine a contribution as was ever made to the State Fair in that line. During the hours of exhibition these instruments were performed upon by some of the most accomplished musical professors, and were especially objects of interest to all lovers of sweet sounds, particularly as the Chickering-Stienway piano war has excited curiosity.

**Leather.**—A fine and most encouraging exhibition was made of a new and growing industry in this State, the production of leather, and leather manufactures. We have in this connection, first the Pacific Tannery and Boot and Shoe Company, of this city, an organization with a capital of \$100,000. This company exhibited sole and upper leather, kip and calf skins, manufactured at their tannery; also, miners' waterproof boots, kip screwed and nailed boots, calf-skin screwed and nailed boots, kip pegged boots, calf-skin tap-sole boots; Oxford ties, nailed and screwed; Congress gaiters, nailed, screwed and pegged, tap-soles; and brogans nailed, pegged and screwed; also, ladies' Balmorals of scarlet cloth and white and blue silk, all-foxed Balmorals, goat-skin Balmorals, ladies glove-kid Balmorals, Misses' calf Balmorals and calf and goat-skin Balmorals. From this list it will be seen that the operations of this company are quite extensive, and we are informed that they have met with great success. The make and shape of this company excels anything in that line of business. The most skeptical can be convinced of the superiority and durability of the work by calling at the stand in the Pavilion of the Pacific Tannery and Boot and Shoe Company, of San Francisco. Eustein Brothers & Co. are agents.

The Pacific Tannery was awarded a special premium, diploma, for their men's factory-made boots; a first premium, diploma, for their factory-made ladies' boots and shoes, and a special premium for their display of leather.

John Bray & Co., also of this city, made a fine exhibit of California leather—sole, calf, kip, morocco, roans (dressed sheepskins), hoot-legs and fronts, hand-made for custom work, all their own manufacture; also, all styles of California lasts, made from California laurel and oak, and especially for them at the Oakland Last Factory. The calf and kip skins appeared to attract much attention from those skilled in leather manufacture. The same firm also made a full exhibit, of shoemakers' tools. This firm was awarded a first premium, diploma, for the best display of leather, and a first premium diploma for their best display of lasts.

M. M. Cook & Son, also made a very fine display of hose and helting, fire-huckets, hose-pipes, harness, etc., all from the manufactory, corner of Battery and Broadway streets, in this city. This firm received a

first premium, diploma, for their display. Hats.—J. C. Meussdorffer, of Sacramento, a branch of Meussdorffer of this city, contributed a very fine display of gentlemen's hats of all styles and material. They also exhibited a case illustrative of the manufacture of hats, showing first the fur and other material in the raw state, and subsequently the body in various stages of progress until it assumes the neat fur and glossy appearance of a gentleman's first-class title. Everybody knows what such a piece of work is when it bears the impress of these manufacturers.

Shirts.—Few persons are aware of the magnitude and importance of the shirt manufacture. Being an article of universal consumption by all the "lords of Creation," their manufacture enters largely into the industrial pursuits of every people. Until quite recently, the people on this coast have depended largely for this article upon Eastern manufacturers. In January last, however, Mr. Martin L. Haas, of this city, organized the "Pearl Shirt Manufactory," and is now manufacturing from 400 to 500 dozen shirts per month. He occupied a prominent position on the upper floor of the Pavilion, where he exhibited shirts of eight different qualities, washed and unwashed, to show both the beauty of the finished goods, and the superiority of the material and workmanship. He also exhibited the shirts in their various stages of manufacture, having five machines at work upon his stand. He has introduced most important improvements into the make of this hitherto neglected garment. He has devised the triple-pointed yoke, named in honor of the factory, the "Pearl yoke," and also two new styles of cuffs. The finishing of these goods is excellent, and the button-holes are marvels of neatness. Their fine plaited shirt bosoms, differing from the French in not being wove, and also in their being three-ply, are claimed to be equally durable with the large plaits. The general get-up of Haas' goods for the trade, more especially in the laundry part, is superior. We shall endeavor to give some important facts and statistics with regard to this branch of business at an early date, under the head of "Our Industrial Progress."

Advertising Table.—Mr. A. N. Rood, general advertising agent for this city, had a table near the main entrance to the upper hall, from which he continually disbursed large numbers of Business Cards, Circulars, Books, etc., representing one house in each of the important branches of business, in San Francisco and Sacramento. Among the business houses thus represented, we notice the names of Locke & Montague, J. D. Arthur & Co., R. N. Van Brunt, Agent N. Y. Life Ins. Co., Homans, Agent Mutual Life Ins. Co., Bradley & Rulofson, Dr. J. B. Beers, Dentist, etc. Mr. Rood did even handed justice to each of the business houses represented upon his table.

The unexpected importance and great interest which has attached to the late State Fair, is a sufficient apology for the large amount of space which we have devoted thereto. We shall endeavor to conclude our report next week.

THE UNION WAR CHART is the name of a new and useful map or chart, containing the dates and places of all the battles and skirmishes of any account, fought during the late war, beginning with the President's Proclamation, calling for 75,000 men, April 15th, 1861, up to the battle of Boquechitto, Miss., May 12th, 1865, the last fight of the war. The events are so arranged that it requires but one glance to determine the particulars of any battle fought during the fifty-two months of war, and gives all the information that could be gained from reading an elaborate history of the war. The chart is published by Lorenzo Dow, of New York. Mr. A. J. Doolittle is agent for the Pacific coast, and may be found at the American Exchange Hotel in this city.

FIRST MAIL STEAMER FOR ALASKA.—The California, Oregon and Mexican Co's steamship John L. Stephens, left this port on Wednesday last, for Alaska. She carries the U. S. Mail, and will hereafter make regular trips to our new possessions in the north. The prompt action of the company named in this early putting a superior sea-going steamer upon this route, is a marked evidence of California enterprise and energy. Mail intercourse and regular means for supplies will do much toward the development of trade upon our northern coast. The Stephens took up about 300 United States troops, and a very good list of cabin and steerage passengers. She is expected to return in about 30 days, which event will be looked for with much interest.

"You may talk to me of Baltimore and Philadelphia and New York, and their railroads and the trade of the Atlantic—let me tell you that the Pacific Coast is already beginning to revolutionize the world."—Speech of Hon. Wm. H. Seaward to the people of Annapolis, Maryland, June, 1857.

ADDRESS

To the Permanent Citizens of the Pacific States and Territories.

Citizens.—We enjoy the finest country that the sun shines on, the most varied and fertile soil, the most extensive seaboard, and the greatest breadth of land having the richest metallic deposits possessed by any one nation of the earth, a land affording all the most varied material for manufactures, wool, hides, cotton, silk, metals, coal, fiber, gum, wood, and, above all, abundance of every kind of food.

We are only a million of people, and yet have more land and sea than Russia with sixty millions—more land than France and Germany, with their hundred millions of people. In the face of those vast resources, there are towns crumbling to decay, men seeking without finding employment. Something wrong here, or this would not be happening. Let us consider.

The instructed mind of the population is mostly devoted to political office-seeking. Their ambition is misdirected. The rising youth is trained to idleness. This mode of thinking and training must be reversed if we would hold this magnificent country against the incoming barbarian.

We must teach our youth the glories of manufactures, of commerce, of industry. We must nourish every effort, however rude, at manufacturing what we require. By devoting some of our capital and our young people to manufactures and general industries we shall soon become busy, get rich, bring more and more people into the country, create new wants, build up new factories and new villages around them; cultivate more land, build more ships, generate more commerce, and thereby create profitable employment for all who want work.

Now, fellow citizens, some money capital is required to help on this industrial movement. Where shall we get it? There is a considerable fund which we may divert from its present bed and channel, viz: the Insurance Fund.

Consider. The people of the Pacific States pay two hundred thousand dollars a month to the Insurance Companies for assuring them against losses from fire and shipwreck.

There are some fifteen of these Insurance offices in this city, each fishing for its share of this large fund. Each office pays a heavy rent, a half dozen officers and clerks, besides printing and advertising; the lowest cost is a thousand dollars a month on each office, and with some it is double that. There are too many persons employed in the business; too much dozing over newspapers; too much red tape and circumlocution; too high salaries and too little work. Think of two hundred thousand dollars a month! Two millions and a half a year! Paid to those sleepy gentlemen for what little they do. This must be reformed. Three or four Insurance offices are quite enough for the million of scattered inhabitants of the Pacific States. A dozen of them may be abolished with great benefit to the community; some one or two have already withdrawn. This change would liberate some fifty men of education, whose business capacity would be of much greater service to the community in other branches of industry, such as manufactures, agriculture, commerce, the fisheries, the forests and the mines. This change would also divert a million or two of dollars to other and more useful industries, whereby a thousand fold more of national capital and employment would be generated than by the present drowsy system.

The managers of the Builders' Insurance propose, with the co-operation of the people, that this vast monthly stream of wealth shall be arrested and diverted to the aid of home manufactures, to effect a great reform and remove from the people's shoulders the expense of supporting a small army of insurance clerks and agents. The Builders' Insurance Company has passed through its first year (the most trying) with singular success. It has gathered a hundred thousand dollars, paid promptly all its losses, and established a business income of fully twenty thousand dollars a month! This has been done while we were yet but an experiment, and enjoying the confidence of only a portion of the public. We now appeal to the entire people. We ask them to send their insurance business to us on the following conditions, and soon we shall have an income of ONE HUNDRED THOUSAND DOLLARS A MONTH, and here is what we shall do with the money.

First, we calculate, from our past experience, that we shall lose by fire and marine disasters half our monthly income (on our first year's experience our losses were but one-third of our income).

Suppose, then, that our income shall be worked up to one hundred thousand dollars a month, and suppose that we shall pay out losses to the extent of fifty thousand dollars a month, we shall still have fifty thousand dollars a month to bank up, (or half a million a year.) We propose to make two parts of this sum—one part (a quarter of a million a year) to be invested in City Bonds, to protect the assured, and one part (about a quarter of a million a year) we propose to convert into a

MANUFACTURERS' LOAN FUND,

which shall be lent exclusively to manufacturers on mortgage of their premises and machinery, at as low rate of interest and on as long time as is generally current on real estate.

By the aid of this fund the budding industries of the Pacific States may be nourished into active life; more and varied employments can be originated for the people; immigration may be welcomed and not feared; the farmer will have got a market at his own door for the produce of his land; the manufacturer will find a lively home demand from the farmer for the products of his machines.

All this, good people, can be achieved, by your own votes at your own firesides, without the aid of Congress or the Legislature—it is simply to vote that your insurance shall go to

the Builders', by which vote you shall enable us to plant factories all over the country. You shall fill the rivers and harbors with busy ships; you shall send out upon the distant waves fishing expeditions that will bring back wealth to your cities; you shall form a nursery of seamen around your own shores—the ova of a future commerce and a protective navy; you will create the hum of busy workmen in every desirable locality on the Pacific Coast; you will bring from neglected fields produce of the utmost value; all of which will most certainly multiply a thousand fold the wealth of the country in which you lot in cast, making a worthy home for yourself and a future country for your offspring.

People of the Pacific States and Territories! We pledge ourselves to you to effect, with your co-operation, some of those things. We have kept all our pledges so far, and have uttered nothing that was not true. Already we have helped to move the shuttle and the loom, which others, with more means, have passed by and neglected. Already we have helped to build and rig ships in our own dock-yards, and sent them over the wide waves in search of riches for the city. Already we have given many liberal bounties and donations to the deserving institutions of the city. Give your vote to the Builders', and we shall share its profits with every useful charity and every honest industry, and help along every enterprise that promises benefit to the people.

We call for the yeas and nays.

- THOMAS MOONEY, President,
EOWASO MACCANN,
WM. B. COOKE,
W. G. WEIR,
J. O. CONNELL,
J. W. MCCORMICK,
C. A. JENKE,
HERMAN SCHWARZE,
J. W. MCKENZIE,
H. V. HERBERT, Secretary.

Directors.

NORTH AMERICA

Life Insurance Company.

Usual Restrictions on Occupation and Travel ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World! J. A. EATON & CO., Managers Pacific Branch, 302 Montgomery st. 2v11nr9b SAN FRANCISCO.

MARKET STREET HOMESTRAP ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

Jacob SHAW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street), takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new 'Cabinet Photographs,' which he is taking to perfection. 10v14tr

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15tr

Save Your Teeth.—On not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. OR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the gaps of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. 6v14tr

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-ly AUSTIN A. WELLS, Agent.

BUSINESS NOTICE.—Mr. A. T. Oewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern Friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

Perry Davis' Vegetable Pain Killer.

We sell the following from the Providence (Mass.) General Advertiser: "At this season of the year, when cholera, cholera morbus, dysentery, and other kindred complaints are sure to prevail, everybody should be liberally supplied with Perry Davis' Vegetable Pain Killer. Persons leaving home, whether it be for a day's excursion or a trip to Europe, should be in a condition to place their hands upon it at a moment's warning. Many diseases incident to the summer months, which will prove fatal if not immediately checked, can be promptly cured by one or two doses of the Pain Killer. On more than one occasion have we been relieved of intense suffering by the timely use of the above named preparation. Sold by all Druggists, Grocers and Medicine Dealers everywhere. 10v15-lm

Builders' Insurance Company—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sanson street. FIRE AND MARINE INSURANCE. 10v14tr9qr

FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v15qr B. F. HOWLAND, Artist.

Copperas! Copperas!

75,000 LBS. IMPORTEO COPPERAS—SULPHATE of Iron—for sale in lots to suit, by BENJ. BRAOY, 104 California street. S. W. corner Davis, up stairs. 13, 15-3m

Boiler Makers Wanted.

WANTED—GOOD BOILER MAKERS, (THAT ARE NOT Society men,) to whom steady employment will be given. Apply to COFFEY & RISOON, Boiler Works, Bush and Market streets. 13v15-4w

LOWER CALIFORNIA Exploring and Prospecting COMPANY.

This Company have procured the services of parties that are well acquainted with the country. This Company will also prospect for Mineral Lands, Water Privileges, Town Sites and Harbors, etc. This Company will dispatch a vessel to explore the Coast, whilst a portion of the Company will go by land to prospect the Interior. For further particulars, inquire at the office. J. W. CAREY, Secretary, No. 20 Montgomery st., Room No. 7. Shares of above Stock, \$10 each—Unassessable. 13v15-3m

ROOT'S Patent Force Blast Blower.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 per cent less power than any Blower now in use. For further particulars, address KEOP, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15tr10p

Oakland College School.

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California. The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art. The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided. Throughout all the various departments, great attention is given to the study of the Modern Languages. For further information, or Catalogues, address, L. H. BRANTON, Principal, OAKLAND, California. 5v15tr9p.

LINSEED OIL.

The Pacific Linseed Oil & Lead Works

Are now prepared to furnish dealers and consumers Pure Linseed Oil, Raw or Boiled, at the Lowest Market Rates. We call especial attention to the quality of our Oil, believing it to be superior to any imported Oil offered in this market. Also, Oil Cake Meal, the best article known for fattening stock and increasing the produce of milk. Cash paid for Castor Beans and Linseed, on delivery at the factory. Address, Pacific Linseed Oil and Lead Works, Care of L. B. BENCULEY & CO., 15v14-3m9p San Francisco.

PACIFIC

Rolling Mill and Forge Co., SAN FRANCISCO, CAL.

Orders addressed to PACIFIC ROLLING MILL AND FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention. The highest price paid for Scrap Iron. 9v14-3m9p

DR. FONDA'S San Francisco Eye Infirmary. Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years principal of the Lafayette (Ind.) Eye Infirmary. P. W. FONDA, M. D., Surgeon in Charge. Office, 402 Montgomery street, opposite Well, Fargo & Co's. 4v15-ly9p

AGENTS WANTED

ENERGETIC MEN OR WOMEN CAN MAKE MONEY by canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v10qr9p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Slide Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Sottlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

**EFFECT OF CARBONIC ACID ON THE HUMAN BODY.**—While workmen were recently engaged in re-opening and repairing the coal mines of Bow Buveur, at Jemeppe, they came upon a gallery communicating with the lower ladders, where they discovered seven bodies of the unfortunate workmen who, three months before, were imprisoned while making their way to the surface. The bodies were completely mummified—the shriveled flesh adhering to the bones. This phenomenon is attributed to the abundant exhalations of carbonic acid gas collected in the gallery.

**A VALUABLE DISCOVERY.**—The New York *Journal of Commerce* mentions a new discovery which already promises important results. It is a species of sponge which grows among the coral formations of the Bahama Islands, and can be used to advantage for bedding or upholstery purposes. It can be furnished so cheap that the poorest artisan can indulge in it.

**TOWNE & BACON,**  
Book and Job Printers,  
Have the Largest Office,  
Do the most work,  
And do it better  
Than other offices  
In this City,  
**536** Try them

DONKEY PUMPS, Etc., Etc., Etc.

The attention of the parties engaged in shipping or inland  
navigation is called to the

**Superior Workmanship**  
of Mr. LOCHHEAD, who has been in the business in San  
Francisco for the last fourteen years, and enjoys the re-  
putation of having built ONE HUNDRED AND SEVENTEEN  
STEAM ENGINES  
Screw Propellers of all kinds, and Steam Boat Machinery  
generally, made to order, and warranted to give perfect  
satisfaction in every particular. 25v12-3m

**SPLendid CARS.**—The long lines of railway now being used, and the necessities for continuous day and night traveling, is bringing into existence great improvements in the construction of cars. "Sleeping cars" have been some time in vogue; "hotel cars" are already in use, whereby all the travelers on a train can enjoy the conveniences and luxuries of hotels, about as well when traveling as when resting from travel. The latest improvement in this direction is "drawing-room cars," two of which have just been completed for the Central Railroad, to accommodate day passengers between New York and Buffalo. They are each sixty-one feet long by nine and a half wide, and contain nine apartments, elegantly fitted up, for the use of families and parties traveling together. Some of the rooms contain accommodations for eight, and some for four passengers. Each car contains sixty-four seats, including those in the general smoking room, which will be used in common by those of the private apartments. Each room is lighted by a large plate glass window forty inches square, affording a magnificent view of the passing landscape, while the interior decorations are of the most perfect and elaborate description. The cost of each car was about \$15,000.

People will soon seek railroad trains, rather than watering places as localities for luxurious ease.

Most of the silver from Chili, which was formerly shipped in the ore, is now exported in the shape of bar silver. This change has been brought about by an improved system of amalgamation. Formerly none of the ore which contained arsenic or antimony could be made available in Chili, but had to be conveyed to Europe, in order that the silver might be extracted. Within the last twelve months the system employed in Europe, has been introduced there in a modified form, and with such successful results that hardly any silver remains in the ore after the operation has been gone through. The probable shipments from Chili and Bolivia for the first six months of this year, are 28,251 tons fine copper, against 29,955 tons in 1866, showing a decrease of 1,704 tons.

**PLATE GLASS** has not yet been manufactured in the United States. This article has hitherto been derived chiefly from Belgium. A practical glass worker, in Birmingham, Penn., has, however, recently invented and put in operation an apparatus for the manufacture of plate glass, which is said to turn out an article equal to the best imported.

**Piles! Piles! Piles!**

NOT PILES OF GOLD, NOR YET OF SILVER, so much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

**WOOD'S SUB-POSITORY.**

It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. The SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it if you are troubled with the Piles—you will not be deceived in it.

**FIRST Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**

It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc., successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a roof tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

**NEW GLOTTI ROOFS** put on, copings and gutters seem cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, docks of steamboats, etc., around New York—for eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis' building, 8 1/2 feet from, on Folsom street, between Third and Fourth streets—only one cent. The work will speak for itself. Now painting the cornice and iron work of Dr. H. O. Cogswell's building, corner of Front and Clark streets—one cent. See the above and further references at our office.

**ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT** is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters, and ground in any color. When used for roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used.

Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

**Dr. Hufeland's Swiss Stomach Bitters.**

THE WORLD RENOWNED REPUTATION, TOGETHER with the extensive and increasing demand for Dr. Hufeland's Swiss Stomach Bitters, will at once be convinced, then to the favorable notice of all connoisseurs and lovers of a good and healthful tonic and invigorator. THE MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors, Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 Clay street, San Francisco.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government laws and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with one but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

MOSHIMER'S PIONEER MINING SCHOOL AND Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches: 1. Assaying of ores, metals and other mineral substances. 2. Technology, or Chemistry, as applied to any special branch of manufacturing. 3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5. Concentration. Dressing of ores. 6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology.

I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works. My lately invented Roasting Furnace has the following advantages: A Furnace of this capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas or quicksilver when unamalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores.....\$3 00 Copper ores.....\$2 00

JOHN F. LOHSE, Secretary. Office, 318 California street, up-stairs, San Francisco. sep14

Gold Quarry Company, Location of Works: Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of September, 1867, an assessment of twenty dollars (\$20) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, room No. 10, second floor of No. 402 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary. Office 402 Montgomery street, (Room No. 10, 2d floor) San Francisco, Cal. sep21

Gold Hill Tunneling Gold and Silver Mining Company.—Location: Gold Hill Mining District, County of Storey, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of September, 1867, an assessment (No. 9) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, R. W. WOOD, 415 Montgomery street, San Francisco, Cal., or to the Superintendent, H. HUGGETT, Gold Hill, Nevada.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the nineteenth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. WOOD, Secretary. Office 415 Montgomery street, San Francisco, Cal. sep21

George Washington Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1867, an assessment (No. 19) of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, only, at his office, in San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the sixteenth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary. Office, 338 Montgomery street, San Francisco. sep21

Hansen Copper Mining Company, Location: Low Divide District, Del Norte County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twelfth day of July, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Shares, Amount. Lists names like Ayres, Washington, Burch, W W, H. Berendorf, J. C. Buxzo, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twentieth day of July, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Badger & Chapman, N. W. corner of Kearny and California streets, San Francisco, Cal., on Monday, the thirtieth day of September, 1867, at the hour of 12 1/2 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN O. HANSCOM, Secretary. Office, at the Etna Iron Works, Fremont street, between Howard and Folsom, San Francisco. Office hours: from 8 A. M. to 12 M. sep13

Kelsey Gold and Silver Mining Company, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of September, 1867, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, northeast corner Battery and Clay streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. V. HERBERT, Secretary. Office, No. 407 California street, San Francisco. sep14

OLNEY & CO., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

La Blanca Gold and Silver Mining Company.

Location of Works: District of Ures, State of Sonora, Mexico. Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like Briel, Henry, Briel, Henry, Meyer, Franz, Walzheim, Max.

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of August, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Doro & Co., at No. 327 Montgomery street, San Francisco, Cal., on Monday, the thirtieth day of September, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOS. GOLDMAN, Secretary. Office, southeast corner Front and Commercial streets, San Francisco, California. sep21

Lady Franklin Gold and Silver Mining Company.—Silver Mountain Mining District, Alpiquo County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the second day of May, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like John Bardsley, John Bardsley, John D. Bardsley, Wm Browning, etc.

And in accordance with law, and an order of the Board of Trustees, made on the sixth day of August, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at the office of the Company, 331 Montgomery street, San Francisco, on Tuesday, the fifteenth day of October, 1867, at the hour of 1 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. S. LUTY, Secretary. Office, 331 Montgomery street, corner of California, San Francisco. sep21

Lady Bell Copper Mining Company, Low Divide Mining District, Del Norte County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twelfth day of August, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like John Farquharson, D F Richards, D F Richards, D F Richards, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twelfth day of August, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Doro & Co., No. 327 Montgomery street, San Francisco, Cal., on Saturday, the fifth day of October, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

B. P. WILKINS, Secretary pro tem. Office, 648 Market street, San Francisco, Cal. sep21

La Blanca Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice is hereby given, that the Annual Meeting of the stockholders of the above Company, will be held at No. 103 California street, corner of Davis, in San Francisco, on THURSDAY, the tenth day of October, 1867, at 7 1/2 o'clock, P. M.

Proxies must be written and filed with the Secretary. sep14-3v JOS. GOLDMAN, Secretary.

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Landor County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of September, 1867, an assessment of three dollars (\$3) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, in San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty-first day of October, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary. Office, 331 Montgomery street, San Francisco.

N. B.—Two per cent. will be allowed on all payments made on the above prior to 4th inst. sep7

North Star Gold and Silver Mining Company, Reese River Mining District, Landor County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1867, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, George H. Faulkner, No. 123 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. sep21

Neagle & Corcoran Silver Mining Company—Location of Works: Storey County, State of Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of July, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like Bell, Rosena, Bell, Rosena, Edwards, A. L., Kennedy, Jas., etc.

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of July, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Doro & Co., No. 327 Montgomery street, San Francisco, Cal., on Monday, the second day of September, 1867, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. P. OREN, Secretary. Office, Room No. 11, 333 Montgomery street, San Francisco, California. au17

POSTPONEMENT.—The above sale is hereby postponed until Wednesday, the second day of October, 1867, at the same hour and place. By order of the Board of Trustees.

sep7 T. B. WINGARD, Secretary.

Neagle & Corcoran Silver Mining Company.—Location: Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of September, 1867, an assessment of fifty cents (50c) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twenty-third day of October, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary. Office, No. 408 California street, San Francisco. sep7

Oxford Beta Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1867, an assessment (No. 24) of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. sep14

Potrero Company.—Location of Works: San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of two dollars and a half (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at No. 533 Kearny, corner of Sacramento street.

Any stock upon which said assessment shall remain unpaid on the tenth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirtieth day of October, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary. Office, No. 533 Kearny street, corner of Sacramento street, San Francisco, Cal. sep14

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo County, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the sixth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like F H Aberding, F H Aberding, F H Aberding, etc.

And in accordance with law, and an order of the Board of Trustees, made on the sixth day of August, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Maurice Doro & Co., No. 327 Montgomery street, San Francisco, on Thursday, the twenty-sixth day of September, 1867, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary. Office, 408 California street, San Francisco. sep14

POSTPONEMENT.—The above sale is hereby postponed until Monday, the twenty-first day of October, 1867, at the same hour and place. By order of the Board of Trustees.

sep24 T. B. WINGARD, Secretary.

Whitman Gold and Silver Mining Company.—Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of September, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary. Office, room No. 10, 2d floor, No. 402 Montgomery street, San Francisco, Cal. sep7

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

All men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

PICKERING'S ENGINE REGULATOR.

Warranted the Best in Existence.

Cheap and easy to attach to any Engine, old or new. Send for a Circular, to HAVIN STODDART, 114 Beale Street, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER, Agents for the Pacific Coast.

Notice to Miners, Well-Borers and Water Companies.

M. PRAO IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAO, Stove Store, No. 125 Clay street, below Dray.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms: No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—Price, \$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—Price, \$500 No. 3—Or 18-inch Crusher, with a similar manner of crush from seven to eight tons per hour—Price, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought-iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, R, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1865.

JAMES BAONIS, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers. Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine, will be found in the Mining and Scientific Press of Sept. 22d, 1865.

BRODIE & RADCLIFFE, Express Building, 402 Montgomery street, San Francisco.

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE UNITED STATES or elsewhere, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERNCES.—E. Stockety, Poisson; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coyville, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular, to KNAPP & GRANT, Agents for California.

26-13-lyqq 310 Washington street, San Francisco

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a First-class Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO., Pacific Iron Works, San Francisco, Aug. 29, 1867.

Mechanical Drawings. Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

E. T. STEEN, Commission Agent for the purchase and sale of Engines, Boiler Castings, AND ALL KINDS OF MACHINERY. No. 608 Montgomery street, San Francisco. HAS FOR SALE One Engine, 6-Horse Power, \$140 One Engine with Boiler, 7-Horse, 600 One Engine, Link for Hoisting, 15-Horse, 900 Two Engines, Boilers, Port., 16-Horse, 1,200 One Engine, 40-Horse, 1,300 One Iron Battery of 4 Stamps, 500 Also, a great variety of Boilers and Machinery, CASTINGS OF ALL KINDS, AT LESS THAN MARKET RATES. Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency.

PATTINSON'S HURDY-GURDY WATER-WHEEL. The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hardy-gurdy wheel," and is considered the most economical Water-Wheel now in use. Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR. THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, 11-15-6m Per Wells, Fargo & Co's Express.

NELSON & DOBLE, AGENTS FOR Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, Oerman, Plow, Blistar and Toe Calk Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine street, Between Montgomery and Sansome, San Francisco.

E. O. HUNT, Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing. HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running; by means of the brake lever at the foot of the mill, by any person. HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State. Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 28 Second St., and 108 and 110 Jessie St., San Francisco.

BLAKE'S QUARTZ BREAKER! PRICES REDUCED! MACHINES OF ALL SIZES FOR SALE. WM. P. BLAKE, Corner First and Mission streets, or Box 2,077 3v13f SAN FRANCISCO.

Steam Pumps, FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT. PICKERING'S GOVERNORS For Steam Engines. Giffard's Injectors, For Feeding Boilers.

STODDART'S IRON WORKS, Beale Street, San Francisco. 23-12-3m

Quartz Mill Construction and Superintendence. THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 26-14-3m

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices. DEWEY & CO., Patent Agents, Publishers and Job Printers, 505 Clay st.

THE Gold Hill News gives the mode of working the ores of the Montezuma mine, in Arabia District, Humboldt county, Nevada, as follows: The ore of this ledge consists of an oxide of lead and antimony, and much of it combines in the form of an antimoniate of lead. The ore contains from \$50 to \$300 of silver per ton, and the entire vein of from fifteen to twenty-five feet in thickness, is about fifty per cent. or one-half metal. It is reduced by smelting. The reduction works at first erected, though incomplete, produced from 300 tons of ore, \$25,000 in fine bullion. The product of the smelting operation is an alloy of lead, antimony and silver, the antimony varying from thirty to forty-five per cent. To separate these metals, two distinct processes are required, and in furnaces peculiarly adapted to each operation. In the first, the antimony is volatilized and driven off, leaving an alloy of pure lead and silver. This is called calcining. In the second, the lead is oxidized, forming litharge, and run off, leaving the silver alone in the furnaces, in large cakes of from \$3,000 to \$5,000 each. This operation is called the cupelling. The ore is readily smelted, the chief expenses being in refining. At present fifteen tons are reduced daily, producing about \$1,500 in silver alone. The pure lead reduced from the litharge, after the loss incident to the operation, amounts to four tons daily. This is piled up to await the railroad which will run within a mile of the works before another year. The lead will then pay nearly the entire cost of producing the silver, leaving that a clear profit. The antimony, now wasted, may be made to add largely to the profits of the mine. The ore is smelted by charcoal, which costs fifty cents a bushel. It is from nut pine, and is from forests of timber twenty-five miles distant from the smelting works. Great labor is required to procure the coal. The fuel for the calcining furnace is sage brush and greasewood of the country, two years' supply of which, it is estimated, lies within a range of three miles of the works. Five first class teams are used in procuring the fuel. The least part of the expense is the wood for the cupelling furnaces, only from half to three-fourths of a cord a day being used to each furnace.

GOLD PRODUCTION IN RUSSIA.—The quantity of gold produced in 1864 by private industry, in the Oural Mountains in Eastern Siberia, amounted to rather less than 19 tons, showing a slight falling off, as compared with the year 1863. The year 1865 was one of the most favorable character for the production of Russian gold, the results obtained having everywhere surpassed those of preceding years. As regards Eastern Siberia, the production of 1865 exceeded that of 1864 by 2,743 tons, and that of 1863 by 1,086 tons. This augmentation, which would have been greater if drought had not often interrupted the works, was the result of works in new bearings. In Western Siberia, 1865 yielded 0.272 tons more gold than was obtained in 1864, and almost twice as much as was produced in 1863. In the Oural district the production has scarcely changed of late years. From an absence of statistical documents as to the production of the State in the Oural district and Eastern Siberia, we can only, in order to form an idea of the importance of its bearings, adopt as a minimum the average production of former years—that is, about 1,670 tons for the Oural group, and 2,293 tons for Eastern Siberia. The total production of gold in Russia was estimated at nearly 23 tons in 1864, and at a little more than 26 tons in 1865.

THE VALUE OF FRUIT IN CALIFORNIA.—Next to the grape the apple yields the largest receipts. Last year the apple crop of California realized some \$400,000, of which San Francisco consumed \$120,000. Next to the apple comes the peach, which reaches within the neighborhood of \$300,000. The consumption of San Francisco is about 82,000 boxes, at a value of 102,500. The plum production reaches \$160,000, of which \$40,000 is consumed in San Francisco. Cherries about \$100,000, of which San Francisco consumes \$30,000. Apricots yield \$60,000, San Francisco consuming \$20,000. Pears amount in the aggregate production to \$70,000, of which San Francisco consumes \$10,500. According to the above estimates, the total yield of the fruit crop of the State is about \$1,090,000; about one-third of which is consumed in this city.

AN Eastern paper very correctly says that through most of the year, in parts of California, they can have strawberries and cream in the morning, and, before noon, a sleigh ride. The Pacific Railroad affords the necessary facilities for the latter.

THE HOOSAC TUNNEL.—The progress at the Hoosac Tunnel, for the month of July, under its new and energetic management, was much greater than for any previous month.

THE TRADE OF RUSSIAN AMERICA IN SKINS AND FURS IN 1866 amounted to \$1,500,000. These furs consist of sea otter, seals, blue and white foxes, mink, muskrat, beaver and bears.

FOREST EXTENSION IN FRANCE.—The effect of the laws against cutting and in favor of planting trees in France has been such that, of late years, instead of a steady decrease in the extent of woodland in the Empire, there has been a constant gain.

"BIO TREES" IN AUSTRALIA.—Dr. Mueller says in the Melbourne Age, that accurate measurement of some of the great Australian eucalypti have been made, and that one grand specimen found in Western Australia, known as Muelleri eucalyptus colosso, was ascertained to be 400 feet high.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

THE SEVENTEENTH ANNUAL SESSION of this College will commence on August 28, 1867. TERMS.—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$350.

The Commercial Herald

MARKET REVIEW

Will be Issued early on EVERY STEAMER-DAY MORNING, (THRICE-MONTHLY).

OFFICE.—Southwest corner Washington and Battery streets, Opposite Post Office and Custom House.

THE HERALD will contain full and reliable commercial details, and elaborate articles on the monetary affairs of the Pacific Coast.

The Letter Sheet Market Review, Containing selections from the COMMERCIAL HERALD, printed on tissue paper, for transmission abroad, will be published simultaneously with that paper.

Weekly Stock Circular.

Merchants can have their cards prominently inserted in the Letter Sheet MARKET REVIEW.

THE CENTRAL PARK OF THE PACIFIC.

Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM,

ZOOLOGICAL GARDENS.

A GRAND INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays a GRAND CONCERT OF SACRED MUSIC, appropriate to the occasion.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.

The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic.

Entrances on Mission and Valencia streets, between Thirtieth and Fourteenth. OPEN EVERY DAY.

Admission to all parts, 25 Cents. Children, under 12 years, half price.

Advertisement for N. P. LANGLAND, STAIR BUILDER, No. 49 Beal street, San Francisco. Includes an illustration of a staircase.

Advertisement for AMERICAN WATCH FACTORY, C. E. COLLINS, No. 603 Montgomery street, San Francisco. Lists various watch models and prices.

Advertisement for WM. H. KEITH & CO'S Proprietary Preparations, listing various medicinal products like tooth wash, lozenges, and perfumes.

Advertisement for Fine Custom Made Clothing, Gents' Furnishing Goods, and Trunks, Valises, Carpet Bags, Blankets, Etc., at J. R. MEAD & CO.

Advertisement for California Steam Navigation COMPANY, listing steamers and routes.

Advertisement for HAYWARD & COLEMAN, IMPORTERS AND REFINERS of Illuminating, Lubricating, and PAINT OILS.

Advertisement for Golden City Chemical Works, LABORATORY, OFFICE, listing various chemical products and services.

Advertisement for THE OLD MAN, THE YOUNG MAN, THE YOUNG WOMAN, THE HUSBAND, THE WIFE, THE DASHAWAY, THE INEBRIATE, THE TRAVELER, and Everybody Takes Them! PRO BONO PUBLICO!

**CORRECTION.**—In the article on "Perpetual Motion," in our last week's issue, certain words essential to the sense were accidentally omitted. We now give the last few sentences of the article as they should be: "A perpetual motion machine is, therefore, in the nature of the case, a chimera. A man may perhaps enlist the sun's rays in his service for a time, and by that means obtain motion, through properly arranged mechanism: but can he so store up those rays that they will furnish a supply of force to be drawn upon during their daily absence. When that has been done, and in such a way as to, require no outside interference until the apparatus falls to pieces from actual wear, we may perhaps modify our assertion."

**New Mining Laws of California and Nevada.**

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents.  
San Francisco, May 1st, 1866.

**BEAN'S HISTORY AND DIRECTORY OF NEVADA COUNTY, CALIFORNIA.**

Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources.

COMPILED BY EDWIN F. BEAN.

Price, \$5—For sale at the office of the Mining and Scientific Press, San Francisco. 13v151f

**MINING COMPANIES**

Can get their Printing done cheaper and better by TRUESDELL, DEWEY & CO., Than at any printing establishment in the city.

**COUNTY OFFICERS**

Can get their Blank Books and Blanks cheaper of TRUESDELL, DEWEY & CO., Than of any other printing house in the city.

**MERCHANTS**

When you want Printing done cheap, send to TRUESDELL, DEWEY & CO., Who do all kinds of Printing at the lowest rates.

**FOUNDRIES**

Will save money by having their printing done by TRUESDELL, DEWEY & CO., Who have put prices down to the lowest rates.

**MANUFACTURERS**

Can get their Printing well done at low prices, by TRUESDELL, DEWEY & CO., Who are now prepared for all kinds of Printing.

**EVERYBODY**

Who wishes to save money and get good work, see TRUESDELL, DEWEY & CO., Who are always ready to receive and fill orders.

**HANSBROW'S CHALLENGE Deep-Well, Mining and Double-Cylinder Patent Pumps.**

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents, LOCKE & MONTAGUE, 112 and 114 Battery Street, San Francisco.

SEND FOR FREE CIRCULAR AND CONFIDENTIAL ADVICE.

ESTABLISHED.....MAY, 1850.

1v15-2am3m 641 Washington street, San Francisco.

Six-Inch Mining Pump.

**THE GOLDEN ERA.**

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

**THE GOLDEN ERA**

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and yielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

**Foundry for Sale.**

A One-half Interest in the **UNION IRON WORKS,** SACRAMENTO, Owned by William R. Williams, is offered for sale on the most favorable terms. **A Good Bargain** May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown from the Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal. 26v13tr9-16p

**Mineral Land Law Blanks FOR SALE.**

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:  
I. Applicants' Declaratory Statement.  
II. Diagram, Description of Diagram and Boundaries, and Notice.  
III. Register's Order for Publication—with Notice.  
IV. Deposition that Notice has been Posted.  
V. Application for Survey Etc.  
PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.  
Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.  
Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

# MINING AND SCIENTIFIC PRESS.

Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,  
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 5, 1867.

VOLUME XV.  
Number 14.

## TABLE OF CONTENTS.

Air Hammers vs Steam Hammers.—Illustrated.	Mechanical Miscellany.—
Formation, Distribution and Age of Igneous Rocks.	Railroad Car Brakes; Mechanical Science; How to Harden Cast Iron; Manufacture of Carriage Wheels.
The State Capital.	Scientific Miscellany.—
Our Lead Supply.	Aluminum; A New Anæsthetic; White Lead Direct from the Ore; the Manufacture of Iron and Steel by Means of Magnesium.
Improved Method of Handling Earth.	Mining Summary.—Embracing late intelligence from the various counties and districts in California, Colorado, British Columbia, Idaho, Nevada, Utah and Oregon.
Useful Publication.	San Francisco Market Rates.
The Fourteenth Annual State Fair.	San Francisco Weekly Stock Circular.
A Simple Hand Loom.	Stock Prices—Bid and Asked.
A General View of the Paris Exposition.	Mining Shareholders' Directory.
New Use for Poultry.	New Incorporations—List of Officers.
Fish Biscuit.	Notices to Correspondents.
Massachusetts Emery.	New Patents and Inventions.
Notes of Travel.	San Francisco Metal Market.
Specialty a Means of Success.	
Fluctuations in Leading Mining Shares for the Past Six Months.	
Important If True.	
Indian Skill.	
Grain Seeds for Coffee.	
Tinning Iron.	
The Heidelberg Tun.	
Editorial and Selected Items.	

seen four solid ears or puppot-heads, for the reception of set screws, by which the dies used to receive the immediate force of the blows may be held in place and adjusted.

Instead of operating the machine by hand and handle, the handle, P, may be removed, and a connecting rod and foot-treadle substituted, so that both hands of the operator

crushing, squeezing, etc. With slight modifications it might also be applied in the place of steam stamps for crushing quartz. The air-compressing pump may also be used as a blast or blower, when not needed for driving the hammer. It gives a very powerful blast for the furnaces, and to very good advantage as to economy. Its speed

## An Improved Mode of Handling Earth.

The handling of hard or rocky earth in deep excavations, as in railroad cuts, grading down hills, etc., is a most tedious and expensive operation. In sand and loose earth, that modern invention, the "steam paddy," has greatly economized this labor, and a giant wooden arm, worked by steam, is made to do the labor of many men. But this machine is inapplicable to hard or rocky earth, which constitutes nineteen-twentieths of all the excavations made; and the only resource has heretofore been to mere manual labor, for loading, with the assistance, sometimes, of a movable tramway for hauling off the earth in cars. When a hill is attacked, it is usual to place a number of men at the top or along the slope of the excavation to pick or blast down the superincumbent earth, which falls to the bottom, where about the same or a greater number of men are employed to shovel it up again and into the carts or cars for transportation.

On passing along the line of excavation on Townsend street, opposite the new gas works, a few days since, we noticed a novel and apparently effective plan of operations, which has recently been introduced there by Mr. H. Hill, and which we have never seen employed before, although Mr. Hill assured us it is not uncommon in deep railroad excavations in England, and has also been used by himself in Australia. Its evident utility is such that we feel quite well assured we shall be doing a good service by describing it, as we believe this *modus operandi* has never yet been placed before any portion of the American public.

In the first place a "heading" or short tunnel is driven into the face of the hill to be removed, of a size sufficient to allow of a horse and cart being backed into it. In the top or roof of the tunnel an opening is made under which the cart to be filled is placed. A properly constructed trap door is employed to close the opening when the cart is filled. This trap door is so arranged with heavy hinges, levers and catches, that it is readily operated by one man, who opens it by means of a short lever, to fill each cart as it is backed into position by the driver, and closes it while waiting for the next one. A cart is thus filled in about one minute. The earth and rock as it is loosened by the pick or blast, descends by its gravity to the trap-door, requiring no handling. If too large a mass of rock is dislodged to pass through the door, it is broken up or rolled away. The excavation is so shaped as to spread out, fan-like, from the trap door to the top of the bank, so that the earth and rock, wherever detached, will all find its way to the proper point. The tunnel must be pushed ahead as fast as the work progresses, so as to secure the proper grade for the rock to descend upon. So far as we can judge, from the appearance of the manner in which the work progresses, we should say that twenty men will do fully as much work, good picking ground, in this manner as fifty can do in the ordinary manner of first picking down the dirt and then shoveling it up. This plan of work is applicable only to ground where the bank to be moved is 25 feet high, or higher. It is equally applicable to all kinds of ground—clay, sand or gravel.

GRIMSHAW'S PATENT COMPRESSED-AIR POWER HAMMER.

## Air Hammers vs. Steam Hammers.

There are many situations and circumstances under which steam hammers are found very inconvenient, such, for instance, as when it becomes necessary to work bright steel, or under any other circumstances where the damp from the leakage of steam, or the dropping of water from condensed steam upon the anvil, would be objectionable. The air hammer also meets the case where water or other power than steam is alone available. It has also the advantage of being always ready for work, not having any accumulation of condensed water in the cylinder and steam passages, as is the case with the steam hammer. The rapidity of action of the air hammer may also be more readily increased than that of the steam-hammer, and the quality of the blows can also be changed more readily, and with greater accuracy. It is claimed that it will do its work with less consumption of power than is usually required by steam hammers, especially when the steam has to be carried for great distances, as is usually the case. The air hammer may be considered an important addition to the general assortment of machine tools for the workshop.

The machine consists of a force pump for supplying compressed air to a reservoir, and a working cylinder and piston connected with the hammer. The force pump and air reservoir are not shown in the annexed engraving. The pipe, B, is used to form the connection between such a reservoir and the valve-box, C, which latter answers to the steam chest of the steam engine. L, L are two screws, which pass through the side of the valve-box, and serve to hold the cut-off slides stationary in any desired position. The slide valve-rod is jointed at G to an arm that is attached to a transverse shaft, and to one end of this shaft is attached the lever, P, by the operation of which the action of the blow is obtained. F is the piston to which the cross-head, D, is securely attached; the cross-head, as it rises and descends, is guided in a vertical line by two guides, where angular edges fit into corresponding grooves of the cross-head. The cubical bed of the machine is a casting of sufficient weight and solidity to ensure permanency and power of resistance to the repeated blows required in the labor of striking. On the upper surface of this bed are

may be left at liberty for the ready manipulation of the material wrought upon. The particular machine herewith illustrated is the invention of Wm. D. Grimshaw, of Birmingham, England; the United States patent being owned by T. Presson & Son, 15 Gold street, New York, on whose premises they are manufactured.

The machine can be used for all such purposes as punching, piercing, stamping,

as a hammer may be varied from one to five hundred blows per minute, with a striking force of from 1,000 to 2,000 pounds. The illustration here given was prepared for and originally given in the *American Artisan*, of February 27th of the current year.

**SENSIBLE ADVICE.**—The *Louisville Journal* says: "Never buy goods of those who don't advertise. They sell so little that they have to sell dear."

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California.

(Continued from Page 146.)

[The following letter from our Paris correspondent, should have appeared in the issue next preceding the one upon the same subject, published Sept. 7th.]

## RAW MATERIALS OF THE PARIS EXPOSITION—FOREST PRODUCTS CONTINUED.

In my last letter, I omitted to mention the important contributions of Austria in this department of the exhibition. The woods and fruits of this State are considered as among the first in value of its natural productions. For variety, quality and cheapness they are hardly rivaled in Europe. The Adriatic sea, the river Vistula, which flows into the Baltic, the Elbe which empties into the North Sea, and the rivers which reach the Black Sea, as well as the railroads, all give facilities for cheap transportation. With these advantages, the exportation of wood has been constantly increasing until it has reached a total value of 75,000,000 of francs.

The quantity of timber sent by the administrator of forests of the different States of Austria, was so great that it could not be exhibited in the building, and it was therefore grouped outside in the *annexe*. The trunks of trees were cut into convenient lengths, which were reunited on the ground, so that their full dimensions are shown. The principal trees are oaks and spruces. Among them *quercus pedunculata* and *Abies excelsa*, are most conspicuous. The former is five feet in diameter at the butt, and is interesting as the wood which is largely used for the manufacture of wine and beer casks and barrels. A great number of staves of all sizes are shown in connection with the unworked woods. Some of these are fifteen feet long, and are intended for a grand cask to hold 100,000 French litres. There are several agencies in Paris for the sale of these staves. This oak grows in deep alluvial soils, and forms thick forests, in which the trees attain a height of more than 100 feet, and a diameter of from four to five feet.

## CORK.

This is a forest product which is of great importance to the wine interest of California; and as it is possible that the cork tree might be introduced there with advantage, a few details will not be uninteresting.

The principal exhibition of cork is from Algeria, and consists of slabs of raw "male cork" eight feet six inches long, with some of second growth, fifteen feet six inches, and specimens of raw cork bark of second growth eight years old. Some of these slabs are from four to six inches thick. The following explanatory statement is taken from the report of DeGayffier: "Cork is the substance lying beneath the true bark of a particular kind of oak, called the cork oak, which grows principally in Italy, Corsica, Algeria, Spain, and the south of France. The tree begins to furnish cork at the age of from twelve to fifteen years; but the first cork is of poor quality, and only fit to make floats and other coarse objects, and Spanish black, which is nothing more than cork burned in close vessels. After the first layer has been removed from the tree, the cork bark is deposited with more regularity, and then yields material fit for the finer purposes, such as the making of wine and other corks, sheets and other well known objects used for many purposes." From the period already mentioned, the cork may be removed from the tree once in eight or ten years, and the same tree will yield cork twelve or fifteen times. Raw cork, or that which has merely been rasped, comes principally from Italy, Spain, Portugal and Algeria. Spain supplies nearly the whole of the manufactured cork of commerce. Seville is the most important *entrepot* of this product. The importations into France in 1855 were 532½ tons, valued at 257,224 francs. In 1865 they had increased to 3,855 tons, valued at 2,502,696 francs. The export amounted to 169½ tons in 1855, and in

1865 it had reached the figure of 1,319½ tons, of the total value of 1,236,900 francs.

The government has encouraged the development of the riches of the cork forests of Algeria, by giving long leases on merely nominal terms to several companies. Large sums have already been expended there in the preliminary barking of the trees, but as yet, there has not been that measure of success that was anticipated. The natives have shown their ill will by burning several of the forests, and some of these enterprises have been abandoned.

(Entered according to Act of Congress in the year 1866, by F. A. Herring, in the Clerk's Office of the District Court of the District of California.)

## Formation, Distribution and Age of Igneous Rocks.

(Continued from Page 194.)

The Bangor deposit is situated along the western flank of this ancient anticlinal axis, and cannot be traced into the Sierra. The Oroville deposit is free of large boulders, and is composed almost entirely of light quartz gravel. There are no heavy deposits of quartz gravel between this volcanic axis and the line of cement and auriferous gravel deposit flanking the present summit of the Sierra Nevada. The mines existing in the intervening territory are what are termed "surface diggings" and quartz veins, which, so far as my observation goes, appear to have been formed during the intrusive era of quartz, or the sixth or new red sandstone period. This vast body of quartz gravel, composing the Oroville deposit, was evidently not drifted from the summit of the Sierra Nevada, or it would have been more or less mixed with large boulders of some other rock; and the conclusion seems unavoidable that the quartz must have found its way to the surface by being erupted from an extinct volcano near its present site.

The earlier stratified rocks seem to have derived their distinctive character from the igneous rock erupted during the period of their formation. Thus, during the eruptive era of granite, gneiss was deposited; during the eruption of feldspathic granite, clay slates and sandy shales formed, and during the eruptive era of the magnesian rocks, altered serpentine, greenstone, and hornblende slates were deposited. The vast deposits of quartz gravel hundreds of feet in thickness at the base of the Sierra Nevada, and covering scores of square miles, and also those vast deposits flanking the summit, and extending from the Feather to the Merced rivers, a distance of 200 miles, and the vast deposits of disintegrated quartz stained with the oxides of metals, which are now cemented into solid rock, may be satisfactorily accounted for on the hypothesis that metalliferous quartz similar in composition with that found in veins, was once erupted in vast quantities. And if it be really the truth, that ores were erupted in such enormous quantities, as these immense deposits would seem to indicate, it follows that placers are more widely distributed, and the ores of the useful metals enter more largely into the stratified rocks than has hitherto been supposed. As we further pursue this subject, we shall learn that such deposits of the ores of silver, lead, mercury, copper and iron do exist. I shall select a few facts which indicate that they also found their way to the surface during the eruptive era of quartz, and enter largely into the formation of the stratified rocks.

Mr. W. T. Rickard, in the MINING AND SCIENTIFIC PRESS, of Oct. 6th, 1866, describes a remarkable silver mine, "situated about two miles east of the Comstock lode. The matrix of the newly discovered mine is crystallized carbonate of lime and quartz. The stratum varies from eight to fourteen feet in thickness, and carries pay ore from one foot to ten in depth. The pay ore is distinguished from the barren portions of the vein by minute spots of sulphide of silver, with arborescent black oxide of manganese, which latter is beautifully developed at the northern extremity of the mine in the form of ferns, similar, but more distinct, to those found in the casings of some portions of the Comstock lode. The lode dips to the east at an angle of about 40°, and has well defined walls of hard schistose-like al-

tered porphyry of a greenish grey color, much harder than the bluish variety found in the Comstock. The lode has been traced some three miles, and it runs nearly parallel with the Comstock. The average value of the hullion taken from this mine is \$1.90 per ounce, as near as possible the quality of that obtained from the Comstock. The general appearance of the ore is very similar to that of the Copiapa in Chili, from which most of the Chili silver is obtained."

Now, that carbonate of lime is a deposit, there can be no difference of opinion. Prior to the Carboniferous era, carbonic acid existed in great abundance in the atmosphere, and the earlier limestones were probably formed by carbonic acid combining directly with oxide of calcium in solution, the compound silting down to form beds of great thickness. The ore of the above described mine, must have been erupted when the bed of altered porphyry upon which it rests was nearly horizontal, and it was subsequently covered by a stratum of carbonate of lime, which protected it from further disintegration and decomposition. By the upheaval of the mountain upon whose flanks it rests, this deposit was tilted up to its present angle, and the geological features of Mount Davidson indicate that it had attained to nearly if not quite its present altitude when the fissure containing the Comstock lode was formed.

The auriferous quartz gravel deposits, upon the western slope of the Sierra Nevada, cover scores, if not hundreds of square miles, hundreds of feet in depth. Deposits of argentiferous ores, of perhaps equal extent, may yet be found in Nevada, and the above-described silver mine may yet prove to be of much greater value than the Comstock vein. Deposits of the ores of the precious metals will be found skirting some volcanic axis of the old red sandstone period. The age or date of upheavals, may be determined by the character of the intrusive rock contained in the fissures found during such upheaval. Thus, feldspathic granite was intruded along anticlinal lines synchronously with the eruption of metalliferous quartz, and we might expect to find deposits of ores at intervals flanking such lines.

J. Alden Smith, of Colorado Territory, mentions a vein of argentiferous galena, the gangue of which is largely composed of heavy spar. Now it cannot be supposed that a deposit of heavy spar could occur at a period very far removed from the eruptive era of rock containing the alkaline metal barium. I am in a great measure compelled to depend upon the observations of others, and in many instances they are deficient in those discriminating marks which are the result of an advancing knowledge. From the language used in Dana's Mineralogy, in describing the Almaden quicksilver mines in Spain, it is to be inferred that the vein matter or gangue containing the quicksilver, is a deposit, in part at least. He says "the mines are not over 300 yards in depth, although so long worked (2,000 years). The mass of ore at the bottom of the principal vein is twelve or fifteen yards thick. The furnaces of Almadenojo's are fed almost exclusively by an ore obtained just east of the village, which is a black schist, strongly impregnated with native mercury and cinnabar, with but little visible. The rock is argillaceous schist and grit in horizontal beds, which are intersected by granitic and black porphyry eruption." It is to be inferred from this imperfect description that the ore of the Almaden found its way to the surface, during the eruptive era of metalliferous quartz. A part of the ore was disintegrated and partially decomposed and entered into the formation of the schistose rock. This schistose rock is intersected by dykes of granitic rock and porphyry, which could not have been intruded at a period later than the beginning of the carboniferous era, thus fixing the date of the eruption of the Almaden ore to the old red sandstone era.

Dana further says: "The ore in the mines of Idria in Austria, is mostly a bituminous cinnabar, disseminated through the rock along with native mercury. The mine is 750 feet deep, and the mining is carried on in galleries, as the rock is too fragile to allow of large chambers. Native mercury in some parts is very abundant." This vein or bed of ore must now be below the water line, and sulphurets are not oxidized under water. It is a noteworthy fact, that the ore in all anticlinal or intrusive veins in California, remains unchanged below the water line, and yet the ore of the Idria mine is very much decomposed. For the decomposition of sulphurets, air and moisture are indispensable, and the inference is unavoidable, that the ore of this mine, at some period in the earth's history, must have been subjected to the action of the atmosphere, and that this ore also found its way to the surface during the eruptive era of metal bearing rock.

Copper and iron are readily dissolved by sulphuric acid, and are found interstratified with the formations of the carboniferous era. Copper lignite has been found in such quantities that it has been mined for reduction. Gold, silver, lead, copper, sulphur and iron are sometimes found associated in the same gangue. I am led to infer, that those metals which combine with the largest proportion of sulphur at an elevated temperature, were erupted in the largest quantity the most recently. Iron pyrites are composed of iron 46.7 and sulphur 53.3, a larger proportion of sulphur than combines with any other metal. Some iron pyrites are not auriferous, and appearances which have fallen under our observation, lead me to believe they were the most recently erupted or intruded in fissures.

The following extract, from a lecture by the President of the Manchester (Eng.) Geological Society, relating to the origin and deposition of certain iron ores, speaks for itself: "The great deposit of Lindale Moor which had been worked, he believed for centuries, was really a valley excavated out of limestone, and filled with iron ore. As to the age of the ore, his own opinion was that it was since the deposition of the limestone, and before the formation of the Permian rock above it. Some years since, Mr. Bolton, a gentleman living near Ulverston, showed him a remarkable fossil which seemed to mark the age of these beds of hematite iron ore, and which caused him to believe that they were all formed during the deposition of the coal measures. His reason for dating the age at which these beds occurred, arose from the fossil which Mr. Bolton showed him—a good *sigillaria vascularis*, displaying good internal structure and external characters, all of which have been converted into peroxide of iron. No doubt that plant grew during the carboniferous epoch, and was afterwards converted into peroxide of iron. The origin of iron ores was now generally attributed to volcanoes. The holes in the limestone containing this ore, he thinks, might have been formed either by waters charged with carbonic acid, or washed by the sea."

If there was a period during which metalliferous quartz was erupted in such quantities as the vast deposits of old red sandstone would seem to indicate, the origin and formation of these deposits of hematite ore may be readily understood. Large bodies of erupted quartz carrying sulphurets of iron coming in contact, while yet hot, with water, would greatly facilitate disintegration and decomposition. The waters of the eruptive metalliferous quartz must have been strongly impregnated with sulphate of iron which was decomposed by the sulphuric acid combining with lime, the iron being precipitated as a peroxide. Peroxide of iron seems only to have been deposited as the coloring matter during the old red sandstone era. It was during this era that feldspathic granite was intruded in a plastic state along anticlinal lines forming cones and belts, frequently of great extent, and with the termination of the old red sandstone period, the granitic era may be said to have passed away.

[To be Continued.]

IMPORTANT, IF TRUE.—It is said that Mr. H. E. Tweedles, of Pittsburg, Pa., has invented and patented a new process for the distillation of petroleum oils, in which steam is the only heating agent employed. It is furthermore claimed that the oil so produced is obtained in such a state as to avoid the necessity and expense of any subsequent purification by alkalis and acids. But six or eight minutes only are said to be employed in accomplishing the result. The quantity operated upon in a six or eight minutes run, is not stated. Steam is undoubtedly to become a most important auxiliary in the distillation and purification of petroleum; numerous experiments in that direction have already been undertaken on this coast, with a greater or less measure of success. Still, we are not exactly prepared for the above announcement, as yet.

The man who invented the Prussian needle gun, has invented a species of dress or covering for the soldier which renders him impenetrable to the ball of the needle gun, or any other gun! What next?

The quantity of zinc obtained from British ores is about 15,000 tons per annum, considerably more than one-third of which comes from the Isle of Man.

Most of the iron mines in Michigan have adopted the old system of mining, instead of quarrying, as recently practiced.

**Mechanical.**

**Railroad Car Brakes.**

We gave a brief notice, some weeks since, of a newly invented steam car brake. This invention appears to have since been put into actual use, with the most gratifying success. A short time since the managers of a large number of railroads, from various parts of the United States, met by invitation on the New Jersey Central road, to witness the operation of this invention. The trial appears to have been highly satisfactory, and the examining committee adopted a resolution, fully endorsing the invention, admitting its reliability at all times, its simplicity of construction, fitness for general adaptation, its great safeguard for human life, saving of property and stock, its positive prevention of sliding wheels, and, in short, its great superiority over all the other engine or hand brakes in use.

This brake is under the solo management of the engineer, and gives him power at once to stop the train at pleasure, without the aid of brakemen. It is described substantially as follows:

The brake is operated by a steam cylinder with 34-inch throw of piston. This cylinder is placed under the foot-board of the engine. Nothing is seen on the engineer's stand but a small lever that opens and shuts a valve, and a 1/2-inch pipe through which the steam passes into the cylinder. A chain passes around, pulling on the piston-head. This chain goes through the train, connected by sections of rods and chains, and the brakes are applied through the agency of small standards in the center of the car. By means of the safety valve in the brake cylinder, the steam escapes when the pressure becomes greater than required for the best braking. By this means the great evil to railroad economy—of sliding wheels—is obviated.

Mr. Wm. Longbridge, of Paterson, N. J., has patented a means of determining, in pounds, the pressure exerted by this brake, a matter of considerable importance to its successful employment, and also a means of most satisfactorily showing some of its points of superiority. At one of the recent tests, seven brakemen exerted their full power at the ordinary brake windlass, and the indicator showed the following results:

A exerted a power of.....	320 pounds.
B " " " " " " " " " "	304 " "
C " " " " " " " " " "	288 " "
D " " " " " " " " " "	272 " "
E " " " " " " " " " "	256 " "
F " " " " " " " " " "	192 " "
G, a beginner, exerted a power of.....	150 " "

The steam brake showed a power of 3,500 pounds. The same power was again exerted, with the same result.

The following will show how quickly a train may be stopped at different velocities:

	Feet.	Seconds.
When running at a speed of 55 miles to the hour, the train was brought to a state of rest from the point where the signal was given, in.....	624	15
Second speed of train 32 miles per hour.....	405	13
Third speed of train 21 miles per hour.....	412	16
Fourth speed of train 21 miles per hour.....	250	16
Fifth speed of train 50 miles per hour.....	721	21
Sixth speed of train 50 miles per hour, hand brakes.....	1317	51

The engineers who have used it express their admiration of its use, and the engineer on the Central Railroad, on the train on which the brake has been in use for seven months, says he will not hereafter run a train to which it is not attached. He can stop a train within two feet of any point designated, at any rate of speed.

**How to HARDEN CAST IRON.**—It is generally supposed that the only way to harden a casting of soft iron is by the ordinary method of case hardening. A correspondent of the *Scientific American*, of August 31, says: "The simplest and best way that I know of is to heat them [small iron castings] to a bright red heat, and then simmer them in common whale or lard oil. If the scale is taken off the castings they will harden quite deep. I have seen quite a respectable cold-chisel made from a piece of common cast iron in this way. The harder the nature of the iron, the better it will harden."

**TINNING IRON.**—The plates to be tinned are now cleaned by scouring between rollers, instead of with acid, as has been the custom.

**SPECIALTY A MEANS OF SUCCESS.**—To gain a name for excellence of workmanship, says the *Engineering*—a name widely recognized in public as well as in the trade—is of immense value; but this often takes many years, and, however worthy the ambition of the true mechanic, the prospect is not one inviting the investment of capital with a view to early and extensive profit. There must be a novelty of some kind to start a business successfully; the novelty must be intrinsically good, and the engineer must know how to push it (for the best invention requires pushing); and he must know, too, how to keep it as much as possible in his own hands. Boulton & Watt's steam engine was such a novelty, and it was well pushed, too. Robert's self-acting mule established the prosperity of the Atlas works, Manchester, and Giffard's injector has contributed greatly to maintain it. Bullough's loom patents have returned hundreds of thousands of pounds in profits to the exclusive makers. Nobody had a monopoly of locomotive-making; but had George Stephenson known of and purchased and defended Neville's patent (of 1826) for the multitubular boiler—and every English locomotive made from the time of the "Rocket" down to 1840 was a clear infringement of that patent—the Newcastle Works would have become well-nigh a mint to the Stephenson family. Who can analyze the wonderful success of Mr. Penn as a marine engineer, and how is it that he has so long carried the Admiralty in his pocket? Gwynne's centrifugal pumps afford another instance of the thorough success of a well managed specialty. Although the late Mr. Appold is the putative father of all centrifugal pumps, and he took out patents, and large numbers of very successful pumps are still made in his name, Gwynne's pumps are nevertheless believed to have paid their manufacturers net profits of nearly £100,000. There are many other successful mechanical engineering businesses, based upon special novelties, still growing up.

**MECHANICAL SCIENCE.**—Mr. Whitworth has addressed to the Science and Art Department the following letter, which was laid before the Select Committee on Paris Purchases: "Feeling the national importance of maintaining the position which England has reached in the manufacture of machinery in general, I desire to do as much as may be in my power toward effecting this object. I should therefore feel obliged if you would inform the Lord President of the Council that I am willing to deposit in the South Kensington Museum [London], to be there perpetually preserved, three original true planes and a measuring machine, or instrument, demonstrating the millionth part of an inch; and I propose, subject to some conditions, to make a sufficient endowment to provide for the delivery of lectures to explain such instruments. Their importance will be manifest when it is considered that the value of every machine when made of the best materials depends on the truth of its surfaces and the accurate measurement of its parts."

**MANUFACTURE OF CARRIAGE WHEELS.**—Twenty years ago the manufacture of carriage and cart wheels was a slow business, all the work on them being done by manual labor. At that time a set of wheels for a carriage, wagon or cart could not be made by a wheelwright under one or two weeks, but now, with the aid of machinery, they can be made in a few hours. Instead of the wheelwright taking the timber from the farmer in the log and plank, and splitting or riving out his spokes, laying them by to season, then working them to the proper size with draw-knife and spoke-shave, as he once had to do, he obtains the spokes all ready turned and finished by machinery. Again, to form the hubs of wheels, the wheelwright had to saw off blocks, bore holes through the center, and turn them in a common hand or foot-turning lathe, all of which occupied much time. The felcos were got out by the use of a common whip-saw, which was by no means a rapid operation. The work is now all done by machinery.

The single firm of Clayton, Shuttleworth & Co., in England, has built nearly eight thousand steam engines within the last twenty years. A large portion of these engines have been those known as portable, for farmers' and builders' uses, etc.

**Scientific Miscellany.**

**The Manufacture of Iron and Steel by Means of Magnetism.**

We gave some account, a few weeks since, of a process said to have been discovered and patented in England by Mr. W. Robinson, for manufacturing iron and steel by the aid of magnetism. A late number of the *Mechanics' Magazine* makes a renewed reference to the matter as follows:

At present we do not see any reason to doubt the result which he therein states that he has obtained; but we do think he has failed to give the rationale of that process, which, of course, in the description of any process, is the thing strictly necessary to be set forth, also each process naturally falls into the category of empiricisms, and not into that of science as applied to art and manufacture. Still, if the results be good, there is no reason why the process should not be followed, providing it be economical. But Mr. Robinson says that he did not fall upon this process by accident, but after lengthened research; consequently, one naturally looks for something like a scientific exposition of it. He says that the object of his research has been the practicability of making wrought iron by the aid of the magnet instead of the laborious, tedious, expensive and somewhat uncertain process of puddling. The facts that led him to believe that such was practicable were the following: He found that some files by using became magnetic, and that such files always lasted much longer in use without showing signs of being worn than others; but he has not been able to ascertain how this magnetism comes about. We think if he tries he will find that any file will become slightly magnetic if he draw-files with it, and not only so, but that any piece of iron or steel will become magnetic if it be filed while it is being turned in the lathe. Another principal fact was, that he found when a compact mass of iron filings were formed between the two poles of a magnet and then broken by force, the appearance was exactly similar to the fracture of a bar of tough iron. These and other facts led him to try the experiment of applying a magnet first to castings while being poured and till consolidation, and then to the melting furnace. In the first instance the castings were bright, like newly cast lead, and would bear riveting when cold, while other castings from the same ladlefull of metal were the ordinary gray and brittle. In carrying out the process in the furnace to replace the puddling process, two pieces of iron were built into the furnace so that their inner ends might be in contact with the melted metal, and their outer ends in contact with the poles of a magnet. When the metal was in a melted state and a magnet applied, the magnetic arc was shown through the melted metal by blue flame and intense ebullition, and in twenty minutes the iron was gathered into a ball, and this iron when rolled was of the finest quality.

Now, suppose there to be no mistake about these results, what is the mode in which the magnet acts upon the crude iron? The mode in which the same or a similar result is arrived at may help us to an explanation. The two principal methods of turning crude iron into malleable iron and Bessemer steel is by the oxidation of the carbon and other matters out of the crude iron. In the puddling process successive portions of the melted iron are brought to the surface by stirring, and into contact with the air till the greater portion of the carbon passes off in the form of carbonic acid gas, etc., and the same thing is obtained much more readily and perfectly by the Bessemer process, by forcing the air through the melted metal. Now, we believe that it is an established fact that crude iron cannot become malleable till the carbon is driven off; therefore, if magnetism produces malleable iron from cast iron it is by driving off the carbon in some way; but if it be driven out it must be in the gaseous form. To render carbon gaseous, oxygen is necessary, and it so happens that among the gases oxygen is a paramagnetic; therefore, in the magnetic sphere there will be a concentration of oxygen. But this will not account for the oxidation of the carbon unless it can be shown that the carbon is brought in contact with the oxygen. On the surface it will be brought in contact with a condensed atmosphere of oxygen, but without stirring how is the carbon, which is mixed or in combination with the metal below, to be reached? There seems to be but one way of accounting for it, viz., this: The particles of iron being magnetic, but the particles of carbon not being so, the particles of iron are necessarily colligated together when under the action of the magnet; and the carbon squeezed

out, the carbon will necessarily rise to the surface and there burn, which it apparently does, from what Mr. Robinson says, producing a great heat and intense ebullition of metal, and oven melting the lining of the furnace and the bricks. Whatever the mode of operation may be, the results being as stated—and we see no reason to doubt them—this method of converting crude iron into malleable iron is by far the simplest and most economical yet discovered. Mr. Robinson has not yet been able to fully carry out his process; existing trade interests have worked against him; but that is what every inventor must expect—at least in England. "Vested interests" are all-powerful for obstruction.

**EDITORS PRESS:**—In your "Scientific" column of Sept. 14th, you mention the comparative force of insects and vertebrata. You say that "while the draught horse can only exercise a force of traction equal to two-thirds of its weight, the cockchafer can draw fourteen times its own weight." I will not dispute the facts claimed in that article, but must question the conclusion of M. Plateau, that "these results proceed not from muscle of a comparatively larger size, but from greater muscular activity." I think the comparison is not well instituted. The vertebrata have not, in the cases named, an equal chance to exhibit muscular activity. Let the cockchafer draw his load over plate glass, sprinkled with emery flour; or give the horse the same power to lay hold of his fulcrum; or let a tom cat pull his load over a three-ply carpet. It is well known that a man, properly harnessed and spread upon a ladder, can hold the best draught horse, on a steady pull. This results neither from larger size nor greater activity of muscle.

JEIGH ARRE.

**ALUMINUM.**—The new processes by which the production of aluminum has been cheapened, are tending to bring this beautiful metal more into use in the ornamental and industrial arts. A chemical establishment is now in process of erection in New York, in which the manufacture of aluminum will be pursued as a leading branch of the business. Alumina, or oxide of aluminum, is pure argillaceous earth; of ordinary clay, alumina is the principal constituent. The general process by which this ore is reduced may be described as follows, viz.: Take a quantity of clay and combine with twice its weight of ferrocyanide of potassium; add also common salt to the amount of one and a half times the weight of clay; raise to a white heat in a crucible for half an hour, and when cool, dissolve out the soluble salts with cold water.

Eventually it will cost no more to produce aluminum than tin, but aluminum is not well adapted for general culinary purposes. Though insoluble in nitric acid in ordinary temperatures, it is soluble in solutions of salt and various alkaline structures.

In this connection, we may remark, that the chief source from which aluminum is now obtained, in France, is from a singular mineral, composed chiefly of a hydrated compound of iron and alumina, to which the name of *bauxite* has been given. Bauxite possesses an ochreous color, inclining occasionally to brown or red. This mineral is found in some parts of the south of France, in considerable abundance; it is only of recent discovery, made, we believe, by St. Clair Deville, subsequently to the introduction of the valuable improvements for the more economical reduction of alumina metal, which possesses so many valuable properties.

**WHITE LEAD DIRECT FROM THE ORE.**—Mr. Bonneville, of Paris, has recently provisionally specified an invention for obtaining white lead (carbonate of lead) direct from the ore. This is accomplished by pouring the molten metal into cold water, to render it as porous and bulky as possible; it is then dissolved in sulphuric acid, and the sulphate is treated with pyroigneous or oxalic acid, combined or not with tincal, dissolves in water, and then dried over the fire on trays. The vessels employed are either made of stone or wood, lined with lead, which become coated with a protecting coating of lead.

## New Patents and Inventions.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

68,076.—WINDOW BLIND.—Wm. Pitt Hoffman, San Francisco, Cal.:

I claim the window-blind and anti-duster, composed of frame, A, V-shaped troughs, B, B, with straight or concave sides, and having the openings, a, a, the partitions, b, b, and tubes, E, G, the latter for the purpose of filling and emptying the troughs, substantially as and for the purpose set forth.

This invention relates to an improved window-blind and anti-duster, which admits of a free circulation of air into the room, and is said to effectually exclude the passage of all dust, and is especially adapted for use on railroad cars. The device consists of a series of V-shaped troughs filled with water, and placed one above the other, and set in the frame usually occupied by the window. Through the front or outside of each trough are pierced two or more holes, at such a height as to allow the surplus water from each trough to run into the next lower one, and at the same time wash off the dust. The inner side of the trough is made a little higher than the outer portion, and the outside is slightly concave, so that the dust will strike the concavity and fall into the water below, while a constant circulation of water, from top to bottom, is had. Mr. Hoffman, the patentee, is in the East seeking to introduce his invention.

68,150.—BUTT HINGE.—B. F. Barker, San Francisco, Cal.:

I claim, 1st, The three-leaf folding butt, constructed substantially as herein shown and described, the two forming a reversible hinge and acting alternately, substantially as set forth.

2d, The plate, A, in combination with the butt, substantially as described.

3d, The muffler, substantially as described, in combination with the butt, as and for the purposes specified.

68,188.—FUMIGATOR FOR DESTROYING VERMIN.—Jona. R. Hamilton, M. D., Portland, Oregon.:

I claim, 1st, The cup or bowl, A, with its insulated chamber, H, and pipe, D, as constructed with stopper, E, in combination with the apparatus, F, or its equivalent, for operating substantially as and for the purposes herein specified.

2d, The pipe, D, as constructed with the end closed, and side openings, e, e, for the escape of the fumes, when said pipe is constructed with a chamber having an inside coating of calcined plaster, or other suitable material, as a non-conductor of heat, as described and for the purposes herein set forth.

68,249.—VALVE FOR WATER-CLOSETS.—W. Smith, San Francisco, Cal.:

I claim the valve, H, working through the annular elastic washer, i, whereby in opening the valve the water in the chamber, J, is allowed to pass freely, said washer preventing the return of the water excepting through the channel, h, as herein set forth for the purpose specified.

The above invention has already been fully described in our columns, under the head of "Recent Inventions."

## RECENT INVENTIONS.

**CIGAR MAKING BY MACHINERY.**—We have already made a brief allusion to the reported invention of machinery for facilitating the manufacture of cigars. By reference to the following extract, smokers may learn that the reported invention is an accomplished fact, and that cigars which have until now been made by hand, may hereafter be made by machinery, at a considerable saving in cost, if we can believe the reports. A cigar-making apparatus has recently been invented in Germany, and patented in this country, which can, it is said, turn out 150,000 cigars a week. A contemporary says:

One of these machines is now in operation in Detroit, and is thus described: "The apparatus consists of several machines, through each of which the tobacco must be passed before the cigar is ready for the outside wrapper, which is put on by hand. It has

a number of valuable features about it, the principal of which are that the tobacco can be worked up dry, and when the cigar is made it is ready for use; that every cigar contains an equal amount of tobacco, that cigars can be made at half the price they can by hand; and that all the stock can be worked up with no loss of material. It requires forty-five experienced cigar-makers to put on the outside wrappers as rapidly as they are made by the apparatus, which can without difficulty make 25,000 cigars every ten hours. This is equal to the average of 90 or 100 experienced cigar-makers. It is estimated that the expense of manufacturing cigars by this machine is reduced about one-half."

**IMPROVED ELECTRICAL CLOCK.**—Herman Wenzel, of this city, is now engaged, conjointly with Stephen D. Field, one of the operators of the Fire Alarm Telegraph, in perfecting an improved electrical clock of their invention, which, it is claimed, will be exceedingly simple in construction, and accurate in operation, and better adapted for general use than any other yet devised. When completed it will be placed in the Merchant's Exchange for public inspection.

**A NEW HYDROSTATIC ENGINE.**—Mr. J. C. Carroll, of McAdams Creek, says the *Yreka Journal*, has invented a hydrostatic engine, which works on an entirely new principle and is a perfect success. The motive power is water conducted through a hydraulic hose, and introduced into a double cylinder, somewhat similar to that of a steam engine. The pressure of the water forces a piston out from each cylinder alternately, by which a wheel is turned by means of an ingeniously constructed flange, which puts the machinery in motion. The engine is in operation on Mr. Carroll's claim on McAdams Creek, where it is used to work the pumps.

**A WONDERFUL LAMP.**—C. P. Pollard, of Marysville, according to the *Appeal*, has recently introduced, as sole agent for the inventor, a most remarkable lamp, which is described by that paper as follows:

The lamp itself is nothing wonderful, but the inside arrangement is. The external appearance is of the ordinary kind of small stand lamps, and is made of brass, with a screw to regulate the burner. The inside, in which the fluid is placed, is double. Between the outside and inside linings raw cotton is placed which absorbs the fluid. The inside lining is perforated so as to permit the fluid to reach the cotton. To prepare it for burning all that is necessary is to fill the cavity of the lamp with the fluid, keeping it in long enough to saturate the cotton lining sufficiently. Then pour it off and light the lamp. A small lamp prepared in this way will burn twelve hours without replenishing. It gives a white, clear light, and produces no smoke or unpleasant effluvia as does kerosene. It is said to be the cheapest light ever yet discovered, and is admirably adapted for the sick-room. The fluid used is called *Lucine*. It will not stain or grease clothing, and only costs \$1.50 per gallon. It is non-explosive. The light is obtained solely from vapor. Turn it upside down or in any direction you will, not a drop of the fluid can be seen. A gallon of the fluid will last an ordinary family six months.

**A NEW REAPER.**—The Salem (Oregon) *Record* notices a new combined reaper and thresher, invented by Mr. Vanderpool, of Polk county, application having been made for a patent. The invention is considered a success, and a separator will be added to it; so that by the help of a man and boy, with a pair of horses, the machine will do clean work, saving all the grain and leaving the straw and chaff upon the field where it should remain to enrich the earth for coming crops. Such an invention seems practicable, and if made to work, will prove invaluable.

**A NEW APPLE CUTTER.**—Mr. Albro Pringle, of Salem, Oregon, has invented a device for cutting and curing apples, that have been pared. It is to be connected with an ordinary paring machine. The Salem *Record* says of it: "By an ingenious arrangement, the Turn Table Parer is fixed on a slide; the slide being drawn out, the apple is put on and pared, and, instead of taking it off, the slide is pushed up against a tin cylinder, in the center of which is a small tube of seven-eighths of an inch, from which to the edge of the cylinder extend strips of tin that divide the cylinder into six parts. When the apple is pared, instead of taking it off, the slide is pushed in and the apple is divided into six equal parts, the core being cut out by the center tube. All is done in an instant; the pieces of apple fall through a chute into anything provided for their reception, and the cores are shoved through the tubes and out of the way. A patent has been applied for."

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
October 4, 1867.  
City Stocks.

The transactions in city shares during the past week have been quite fair, with a slight improvement over previous quotations. Spring Valley Water stock was in request at \$68 75 @ 69, with some outside sales at a slight advance. Omnibus R. R. was in the market at \$61 per share. The cars of this company now run to the new wharf of the Pacific Mail S. S. Co. at the corner of First and Brannan streets, carrying passengers within a few steps of the steamers. North Beach and Mission R. R. stock has been selling at \$52, being firm at this rate, and showing an upward tendency. A few shares of Gas stock sold at \$68, and California Steam Navigation Co. at 72 1/2 per cent. National Insurance Co. realized \$69 per share. A small amount of Sacramento County bonds sold at 70 per cent.

At the annual meeting of the stockholders of the Bank of California, held on Tuesday, the 1st inst., the following named gentlemen were chosen Trustees for the ensuing year: D. O. Mills, W. C. Ralston, William E. Barron, N. Lanning, Thomas Bell, D. J. Tallant, A. Hayward, Louis McLane, John O. Earl, L. Sachs, and A. J. Pope.

The City Bank of Savings filed a certificate of incorporation in the office of the County Clerk within the past week. The object of the association is to aggregate the funds and savings of the members and depositors, and invest the same for their common benefit in such real and personal property as may be designated by the Board of Directors, to carry on a banking and discount business, receive deposits of money, etc. Capital stock \$750,000, divided into 7,500 shares of the value of \$100. The Directors for the first six months are: H. A. Cobb, Robert Foley, Robert Barry, Michael O'Neil, D. B. Murphy, James McNamara, Michael Daley, Daniel Murphy, Daniel O'Brien and John Shineberger.

The San Francisco Insurance Co. in a statement rendered Sept. 30, 1867, show their assets to be \$375,508 15. Deducting the capital stock, which is \$300,000, it leaves a surplus of \$75,508, and taking from this the proportion of premiums required to reinsure all outstanding risks, they report a net earned surplus of \$52,234 15. A dividend of 4 1/2 per cent. is payable to the stockholders since the 4th inst.

The sales at the regular sessions of the Stock and Exchange Board during the month of September for the past four years compare as follows:

September, 1864. \$1,235,980 September, 1866. \$1,758,190  
September, 1865. 4,829,501 September, 1867. 4,193,854

## Mining Share Market.

During the week under review the mining share market has undergone a very marked change, every share on the list showing a heavy decline from closing sales of last week. Several of the leading stocks have been largely dealt in, and under strong speculative operations have possibly been brought to a lower point than would otherwise have been the case; however this may be, these extensive sales had the effect of producing a general decline. It is not to be questioned but the present indications of a continuous large yield of the various extensively developed claims on the Comstock Lode, at least for some months to come, are not so promising as formerly. From all the information we can obtain the diminution of the ore product in quantity is very slight, but the quality is not near so good.

**CROWN POINT**—is in less favor, opening at \$725, advancing to \$755, falling to \$710 @ 660, and closing at \$680. Water has been somewhat troublesome in the shaft within the past few days, preventing the starting of the east drift toward the ledge from the 700-foot level. It will be reached at a distance of seventy-five or eighty feet. The north drift and north winze on the 600-foot level are said to continue in good ore. The new hoisting machinery was started on the first instant.

**HALE & NORCROSS**—is coming more freely into the market at lessening rates, rapidly declining from \$900 to \$525, and closing yesterday at \$550. During the month of September this company reduced 2,612 tons of ore, which gave a 65 per cent. assay yield of \$71,692 32, equal to \$27 44 per ton. In August the average product of hullion was \$38 47 to the ton, showing a decrease in September as compared with that month of \$11 per ton. It is a rather singular

fact that the quality of the ore decreased very suddenly, the average assay value falling from upwards of \$40 to \$27 per ton in one day, at which rate for a month or more past it has remained with little change for the better. The prospects of finding the same profitable kind of ore as has been heretofore extracted at a greater depth are thought by some to be very fair, while the very rapid decline of the stock seems to inspire holders with a different belief.

**SAVAGE**—continues to change hands to a very large extent under a rapid decline from \$153 to \$107, closing yesterday at \$115. The product of this mine continues very fair, amounting to 1,962 tons during the week ending Sept. 28th, against 1,879 tons extracted the previous week, and showing an average assay value of \$37 65 against \$41 40 per ton of the week ending Sept. 21st. From the north mine of the seventh level 934 tons were taken, middle and south mines of the second station 415 tons, and from the north and south mines of the third station 613 tons. In regard to the present condition of the mine we learn that the Potosi chimney still looks well, and that the south mine is producing more than was expected. The ore found in the winze in the north mine on the seventh level proves to be of a low grade, and another winze at the junction of the middle and north mines, at a depth of upwards of forty feet, carries second class ore. The drift northward from the third station is said to show some improvement, with some indications of considerable ore to the east, to which point the drift has been directed. In the winze from the middle drift on this level, at a depth of 40 feet, the same grade of ore is found as heretofore reported, and the drift south from this point continues to yield a fair quality of ore. The ledge has been reached from the fourth station. A heavy flow of water interfered for several days, but work was again resumed on the 2d inst. It is expected that a dividend of \$10 per share will be paid this month.

**CHOLLAR-POTOSI**—declined from \$382 to \$280, then sold at \$260, and closed at \$261. On the first instant a slight cave of waste from the second station interfered with work on the third Santa Fé level for a day or so. It is from this level that the greater proportion of ore is at present obtained, while the new Santa Fé level adds a fair supply, said to assay \$45, and the Pinta station a limited amount, showing an average of \$49 to the ton. Preparations are complete to run drifts from the lower station in the new shaft, the operations at this point being mainly governed by the amount of earth required to be raised from the shaft where repairs are being made, since one reel must do all the work. During the week ending Sept. 26th 2,548 tons of ore were sent to custom mills against 2,786 1/2 tons during the previous week. The hullion returns for the month of September will be less than the August yield.

**GOULD & CURRY**—has been little inquired for, declining from \$380 to \$315 seller 30, and closed yesterday at \$300. Up to the first instant \$75,842 74 in hullion has been received at the office in this city. We have nothing of interest relative to the mine.

**IMPERIAL**—declined from \$159 to \$110, and closed at \$121. The hullion returns for September amount to \$97,479 36 against \$89,280 received in August. GOLD HILL QUARTZ sold at \$100 per share. This mine is said to be looking better, yielding a considerable amount of very fair ore. It is thought that the yield of hullion for the current month will exceed the returns made in several months past.

**OPHIR**—has been quiet, declining from \$75 to \$62, and closing at \$55. They have encountered a large volume of water in the new shaft, which will require the aid of the machinery now being put up in order to prosecute further work. An assessment of \$3 per share or \$36 per foot was levied on the 27th ult.

**YELLOW JACKET**—receded from \$520 to \$410, and closed yesterday at \$430. BELCHER from \$130 to \$102 50, closing at \$100. KENTUCK from \$250 to \$182, selling at the close at \$185. EMPIRE has been inactive, a few feet realizing \$175. BULLION has been selling at \$18 50 @ 22 per share.

**OVERMAN**—has been in less request, declining from \$58 50 to \$35, and closing at \$41. On the 29th ult. \$5,625 in bullion was forwarded to the office in this city, making upwards of \$18,300 for the month of September.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last amounted to \$1,542,514.

**MINING MACHINERY.**—We understand that Mr. J. H. Stewart has made sale, during the past week, of nine of his pans; one of them to the Enterprise mine, in Plumas county, the others to the Eureka mine, in the same county, for the purpose of working the tailings from the same. A cut of these pans may be seen to-day in our advertising columns.

**PICNICS.**—All in search of health, pleasure, or recreation, will find Woodward's Gardens one of the most desirable places of resort this side the garden of Eden.

Fluctuations in Leading Mining Shares for the past Six Months.

Table with columns for Name of Company, April 10th, April 20th, April 30th, May 10th, May 20th, May 30th, June 10th, June 20th, June 30th, July 10th, July 20th, July 30th, Aug. 10th, Aug. 20th, Aug. 30th, Sept. 10th, Sept. 20th, Sept. 30th. Lists various mining companies and their share prices over time.

Advertisement for 'ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY' by Prof. LAYRES. Includes text: 'For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.' Price, postage paid, \$1.10.

MINING SHAREHOLDERS' DIRECTORY.

San Francisco Market Rates.

Table with columns: Wholesale Prices, Retail Prices. Lists various commodities like flour, sugar, oil, and their current market rates.

CONSEQUENCE OF BAD FAITH.—One of the consequences of the bad faith exercised on the part of some New York contractors for several war vessels of the Japanese Government, wherein the said contractors failed to carry out their contract after receiving their money, has already been visited upon Horace D. Dunn, Esq., of this city, the correspondent of the National Department of Agriculture for this city.

Mr. Dunn had arranged with the Japanese Commissioners, late in this city, for an exchange of California fruit trees, vines, plants and seeds, for those of Japan, and expected to have received an assortment from Japan in season for setting out and planting next spring, while his California seeds were en transitu. The last incoming steamer from Japan, however, politely informed him that as the proposition "will be advantageous to both countries, we will collect and send them when you have sent us those of yours."

PURE WINES, SPIRITS AND TEAS.—The long train of evils growing out of the indiscriminate use of the various adulterated and villainously fabricated compounds—dealt out to the inconsiderate in the shape of "chain lightning," and carrying with it disease, desolation and death in a thousand forms—has for many years attracted the attention of the wisest statesmen of both Europe and America, and much has been done to abate the evil by means of salutary legal provisions.

But as the wisest statutory enactments are liable to evasion, a wide field for enterprise and usefulness was left open to such firms as Biniger & Co., of New York; Bigelow & Daves, of London, and other houses in both the Old and the New World, who have perhaps effected even more than statesmanship and philanthropy by giving to us a pure article of wine and spirits—untainted with copper, lead and logwood, or other poisonous dyes and drugs. In this connection we are pleased to state that Messrs. Whiting & Berry, who have accumulated a valuable fund of experience as wine merchants, here and elsewhere, at the earnest solicitation of some of our oldest citizens, have recently opened an establishment at 609 Sacramento street, which is intended as a depot where selected teas and spirits may be procured, at wholesale or retail, for medicinal and family use, and where every facility is offered to ladies as well as to gentlemen in making their own selections and purchases. The special attention of apothecaries, physicians and families, and all dealers who have a proper regard for the lives and health of their patrons, is called to their advertisement, which will be found elsewhere in our columns. The public need have no fears as to purity and genuine character of the different beverages here offered, from the fact that those gentlemen have too much at stake, in the way of reputation and the large amount of capital invested, to afford a disappointment. As a further guarantee, all wines and spirits will bear the impress of the signatures of the firm upon the label of each bottle, or be otherwise indorsed, to guard against all imposition.

THE PNEUMATIC RAILWAY WILL SOON BE INTRODUCED UPON THIS CONTINENT, BETWEEN JERSEY CITY AND NEWARK.

The tube will be of wood, constructed of staves and hooped like a barrel, three feet in diameter. It will cost about \$10,000 per mile.

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 O'CLOCK A. M. of the following dates, for PANAMA, connecting with Panama Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK. On the 10th, 19th and 30th of each month that has 31 days. On the 10th, 19th and 30th of each month that has 30 days. When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following. Steamer leaving San Francisco on the 10th touches at Manzanillo, All touch at Acapulco. Departures of 19th or 19th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Departure of 19th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America. The following Steamships will be dispatched on dates as given below: October 10th—MONTANA, Capt. E. S. Farnsworth, Connecting with GREAT OCEANIC, Capt. Gray. October 19th—OLDEN CITY, Capt. W. F. Landge, Connecting with the RISING STAR, Capt. Conner. October 30th—SACRAMENTO, Capt. Parker, Connecting with ARIZONA, Capt. Maury. Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attendances free. These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock. Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England. For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO. The Steamship CHINA, Capt. E. W. Smith, will be dispatched October, either via New York, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI. For all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets. OLIVER ELDRIDGE, Agent.

Latest Stock Prices Bid and Asked.

Table with columns: Bid, Asked. Lists various stocks and bonds with their current market prices.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Sept. 22d: One day this week the Silver Creek quartz mill was seriously damaged, and for a time thrown out of use, by gross carelessness in the engine department. The damage consists of the breaking of two stamp eams, and the cast iron flange to the battery pulley on the main shaft. The mill had crushed about nine tons of second class Tarshish ore, six tons only of which was amalgamated, and this accident will cause a delay of two weeks in the work of producing bullion.

A change has occurred in the rock in the Mowyer tunnel, which indicates that they are running in the right direction to strike the lode.

## Amador County.

*Ledger*, Sept. 28th: Coney & Bigelow will commence, on Monday next, to re-timber their shaft and put it in order for winter operations. They will also erect steam hoisting works of a superior kind. This is much needed, as they are now down over 200 ft., and intend sinking 100 ft. more immediately.

## Butte County.

*Chico Courier*, Sept. 27th: We have a piece of wood taken from the center of a large conglomerate boulder, in the mining claim of J. L. Boles, on Chico Creek, about 20 miles from Chico. The boulder was blasted to get it out of the claim, and the wood found in the center. The wood looks like cedar, and must have been embedded several thousand years.

*Oroville Record*, Sept. 28th: The Oroville Mining Co., whose claim is situated on the bluff at the head of Downer street, have been at work for some time, and are doing well. Their flume has a water capacity of 1,200 inches, and they are prepared to wash an immense quantity of dirt, if they can get help to shovel it into the sluice boxes. Mr. Hewitt informs us that he can give steady employment to 25 men, and that means American miners, at good wages. There is a general complaint of the scarcity of help in this vicinity.

## Calaveras County.

*San Andreas Register*, Sept. 28th: The Irvin quartz mill is working to a charm, and gives general satisfaction. They have in operation, at the present writing, four stamps of 500 pounds each, but intend, as soon as pipe of sufficient size can be obtained to supply the works with more water, to put in force four more of the same weight. This claim, without a doubt, is the richest one yet discovered in Calaveras county, and will pay Mr. Irvin handsomely in a short time.

## Inyo County.

*Virginia Enterprise*, Sept. 27th: We were yesterday shown a lot of ore from Walker River of a very peculiar nature. It appeared to be a mixture of all kinds of minerals—copper predominating. The specimens shown us certainly are rich in silver, but contain hardly a trace of gold. Assays will shortly be made of the ores, when their exact value will be ascertained.

Sept. 28th: The following telegram has been received in this city, from J. B. Low, superintendent of the Kearsarge Co., Inyo county: "I forward you by to-day's stage, in charge of a messenger, 11,160 ounces of bullion in bars; also a sample of rich ore found in the lower tunnel."

*Trespass*, Sept. 30th: Saturday afternoon the bullion from the Kearsarge mill and mine was received in this city by Mr. Reynolds, and duly forwarded to California. The bullion is the result of 70 tons of ore, being over 160 ozs. to the ton.

Mr. Bush, a reliable gentleman, who has just returned from the Lone Pine District, gives the following description of the mines: The lodes are bold in outcroppings, and lie north and south, pitching to the east as sunk upon. The widths of the ledges vary from 9 to 15 feet on the surface, with a rich vein in most of them from nine inches to two ft. in width. The Mexicans, by whom the country is principally located, work the rich vein only, smelting the ores in adobe furnaces, and leaving the balance of the ledge (which by mill process will pay at least \$150 per ton) a mass of refuse quartz; or, they will gather perhaps three cords of wood, and build a pile, composed of alternate layers of dry pine and ore, when it will be set on fire and in a few hours be reduced to a smouldering mass, from which will be taken from 700 to 900 pounds of metal. This metal will in turn be taken to the adobe furnaces, and there refined, in due Aztec style, to bullion, which will in turn be refined at the hands of competent assayers.

The general character of the ore is galena and antimonial silver; the whole formation of the lodes seeming to consist of a succession of metallic boulders, until a depth of 18 to 30 feet is reached, when the casings become perfect and vein matter becomes fused into a solid ledge. On the ledges, particularly at the Cerro Gordo camp, quite an amount of labor has been expended, and several shafts have been sunk, some as deep as 45 ft.; but most of the work is done in the regular Mexican style—an excavation from which ten tons of ore has been taken being ten times the size that necessity requires. All of the ore worked in the district, so far, has been by smelting process, although two or three arrastras have been constructed, and are in operation ten miles from the mines, and giving good returns of the ore. Following are returns from ore of several mines which Mr. Bush saw worked: Saturn ore, 90 pounds, 41 ozs. bullion; Bueno (Good Luck Co.), 100 pounds ore, 18 ozs.; Mexican, 100 pounds ore, 40 ozs.; San Judas, 300 pounds ore, 51 ozs. We were also shown some ore from the Union mine, the rich vein in which is two feet in width, which was taken from the ledge at the depth of 80 feet, and which is almost a pure mass of silver. The mines above mentioned are prominent for their richness, yet there are hundreds of ledges along the mountain that assay from \$100 to \$300 per ton. Some of the more intelligent of the Mexicans resolved to try some of the ore by mill process, and accordingly about three weeks since 7,200 pounds of ore from the St. Lucas lode were packed to the Kearsarge mill—a distance of 45 miles—and there worked under the supervision of Mr. Low. That quantity of ore returned by mill process 116 lbs. of bullion, which Mr. Bush saw; and after paying all expenses for transportation, milling and mining, returned a net profit per ton of \$190. These statements can be relied upon as correct, notwithstanding the seeming impossibility of so rich ore being found on the surface.

## Mariposa County.

*Gazette*, Sept. 28th: Work is progressing on the Princeton mine. The mill has constantly been in operation since May, during which time the average yield of gold has been about \$20 per ton. The company propose to give more attention to this mine when their dam on the river is completed and the Benton mills are in operation.

A Mexican at Hornitos, a few days since, struck a pocket in Quartz Mountain, immediately in the rear of the town, and took out upwards of \$3,000. The strike has given encouragement to others, and a number are now at work on the same mountain.

## Nevada County.

*Transcript*, Sept. 27th: Ten tons of rock from the Oceola ledge, at Rough & Ready, has been crushed in one of the Grass Valley mills, and the yield amounted to \$15 per ton.

Sept. 28th: From five tons of rock from the Scandinavian ledge, taken out in opening the drift, and crushed at Palmer's mill, \$25.31 was taken. Extensions are being taken upon both sides of the Scandinavian, and other ledges have been sought for and been found.

The Pride of the Valley, the Maggie and the Bold Soldier Boy promise rich developments. Apart from quartz, Pleasant Valley is lively on account of gravel diggings. The Red Jacket seems to be the regular blue gravel lead which makes Smartsville famous, and a company is running a tunnel into Beckman Hill with every prospect of finding a rich deposit of gold.

Oct. 2d: Gilchrist & Co. have opened a new quartz ledge near the Half Mile House. They have sunk a shaft from which they have taken 25 tons of fine looking rock. This will be crushed soon in order to test its value.

*Gazette*, Sept. 27th: The Star mill and mines above Cañon Creek, have recently been leased by the trustees of the company to Messrs. James & Pierce of this city, both practical miners.

Sept. 28th: The Mary Etta mine, on Diamond Creek, three miles above Omega, was sold yesterday to James E. Perkins & Co. of San Francisco. The amount paid we are not permitted to state, but it was sufficient to insure its recent owners a snug fortune. The new company have a working capital of \$50,000 and will develop the Mary Etta as rapidly as possible.

The Ben Franklin Co. at Grass Valley cleaned up yesterday 321½ ozs. of gold, worth \$16 per ounce. The number of tons crushed was 150; yield per ton, \$34.30; total, \$5,144. It was crushed at the McCauley mill.

Sept. 30th: During a visit at the works of the North Star Co., Friday afternoon, we saw a car load of remarkably rich quartz as it was brought out of the mine. The rock was literally spotted with gold, some of the

quartz being crystallized, and making beautiful specimens.

H. McCormick's mine in Bear Valley is progressing favorably. The shaft is down 57 ft., having gone through a bed of cement and conglomerate boulders. They are now in a bed of pipe clay, and the indications are the same as found in the hydraulic diggings at Red Dog.

The new hoisting and pumping works of the Dromedary mine, have been completed, and are now in operation.

The mill of the Birchville Co. is nearly completed, and will be put in operation in a day or two. The mill has five stamps, and was originally built to crush cement; but the cement claims not turning out well, it was sold to the Birchville Co., and has been removed to their mine.

Oct. 1st: We saw yesterday some rich specimens of gold-bearing quartz lately taken from the Yellow Diamond ledge, at Rock Ravine, near Cement Hill. Some years ago an extraordinary rich pocket was struck in this ledge, and a few hundred lbs. of rock yielded several thousand dollars; but the ledge has been worked considerably since and with poor success. The extent of the pocket lately struck is not known.

The Eagle Co. at Relief Hill, is now in full blast. They have 1,500 ft. of iron pipe, varying from three feet to one foot and three inches in diameter. Their claims are extensive and they are prepared to work them on a scale corresponding with their extent. The Union Co. is working from 20 to 30 men.

Oct. 2d: We saw on Monday, at Delano's bank, Grass Valley, a gold brick weighing 400 ozs., and valued at \$7,200—the result of a crushing of quartz from the New York Hill lode. The mine is now fairly opened, is worked regularly, and is affording the owners good profits. The gross receipts from the mine for last month amounted to \$17,000.

Grass Valley Union, Sept. 27th: The hydraulic mining interest of Rough and Ready looks better at the present time than it has looked for years, and the preparations now being made to open and thoroughly work several claims, warrant the belief that this portion of Nevada county will render an excellent account of itself during the approaching hydraulic mining season. The Slate Creek and Deer Creek ditch, will now carry 600 in. of water, thus affording the hydraulic miners an opportunity to open their diggings. Vial & Co. of Grass Valley, have located the old Slate Creek Hill, and have commenced a tunnel on Fiddler Flat, to be run a distance of 600 ft., to open their claim. They are preparing to lay 2,500 ft. of pipe, most of which is now on the ground. On Goshen Hill, C. A. Smith and Allen Williams, of Grass Valley, are preparing to open the Hawes diggings. On Bunker Hill Hon. E. W. Roberts has commenced putting in a new 30-in. flume, to be 60 ft. in length, to work the old Sazerac diggings, which will be in working condition by the time water comes this fall. The Harris Bros. have sold their hydraulic diggings on Negro Creek, to a company of Portuguese, but we did not learn the figures at which the diggings were sold.

The Osceola mine is showing well. Last summer a shaft was started, which recently cut the vein at a depth of 60 ft., disclosing a vein 20 in. in width, but very much broken. A crushing of a few tons of rock from this point, made this week, showed a return of \$14 per ton. Considering that the ledge was broken, and that considerable quantities of slate and cab were mixed with the quartz crushed, this yield is quite satisfactory. The intention is to sink 30 ft. deeper on the incline before any drifting is done on the lode.

*Excelsior*.—Meadow Lake *Sum*, Sept. 28: The Gold Run Co. are taking out splendid ore from the first level of their mine. They have just struck a very rich streak, about 18 inches wide at this point. The rock is of a porous or decomposed nature, and shows a considerable quantity of free gold. A train of mules is employed packing rock from this mine to the Mohawk mill for crushing.

The Enterprise Co. are erecting a furnace for roasting rock, and thus facilitate the reduction of their ores. The process to be used is what is known as "Williams's superheated steam process." They have levied an assessment of \$1 per share on their mine, and intend to drive things ahead in proper style.

The boys of the Shooting Star Co. have levied another assessment of \$1 per foot.

The Excelsior Co. have struck some fine looking ore in their shaft this week.

## Placer County.

*Auburn Stars and Stripes*, Sept. 25th: McGougle & Co., in running a tunnel, run across a singular black formation, which, at the time, was rejected. On close inspection, specimens of this rejected black stuff exhibited, to use a miner's expression, "slathers"

of gold. Investigations that followed showed that the black stuff constituted a regular and well-defined ledge of gold-bearing silicate, which has been traced, up to the present time, a distance of 600 feet, and which, at the point where they are now working, is fully seven feet in thickness. The course of this ledge or streak, from the point of discovery as far as traced, is about N. 65° W. It is as easily worked as the softest slate, and after exposure to the air for a short time is as easily pulverized as dry clay. Large portions of it are richly studded with gold, and a considerable portion will yield \$1 per pound! Several tons have already been taken out, and it is reported that it grows richer as they go down.

Wentworth & McClure, on Squires' Cañon, in a first class manner for the coming winter.

It is reported that excellent pay has been struck in one of the tunnels at Blue Bluff, in which work has been prosecuted for ten years without remuneration.

Dutch Flat *Enquirer*, Sept. 28th: The King brothers, blue cement miners at this place, have realized \$5 per cart load for all dirt broken from their drifts this summer.

A Mr. Smith, mining alone near Owl Camp, above Lost Camp, has a claim that is paying very well; he realized therefrom, one day this week, five ounces.

*Herald*, Sept. 28th: On Wednesday last McGonigle & Co. struck it rich. One pan yielded about \$1,000. Fifty dollars per foot is the lowest that any interest in the claim can be purchased for.

Dutch Flat *Enquirer*, Oct. 2d: At Gold Run, ground that has heretofore been considered worthless is being worked with results highly satisfactory. One claim, owned by Mr. Jacob Abeel, on being opened and run for 16 days, yielded \$1,800. Other claims situated in the neighborhood of this claim have equally flattering prospects. The claim of Messrs. Wentworth & Wolcott is in rapid process of opening.

The cement mill at Dutch Flat continues to pound the richest gravel, and their returns will far exceed any former crushing. The prospecting for this lead in other claims in this immediate vicinity proves, conclusively, the existence of a continuous cement lead from the King Bros.' mill to Nary Red, a distance of over a mile. This will furnish ground enough to supply at least a dozen mills.

The mines at Gold Run, always good, are sustaining their reputation nobly by yielding large sums to their owners.

Mr. Osmyrn Harkness, after a run of 24 days in his claim between this place and Gold Run, cleaned up over \$5,000, four men working.

## Shasta County.

*Courier*, Sept. 28th: Peter Larkin & Co. are making from \$15 to \$20 per ton to the hand.

Jollie & Dosh, after making a short run on rock taken from their ledge at Muletown, cleaned up last week, and found that they had cleared \$10 per day. The owners of the Potosi also cleaned up a run from their mill last week, which paid handsomely.

The company formed in this place some months ago, for the purpose of prospecting for the lost Fifer Hill lead, at Pittsburg, has abandoned the enterprise, after running a tunnel 150 feet across Pittsburg Flat, and striking no pay of any consequence.

## Sierra County.

Downville *Messenger*, Sept. 28th: The Docile Co., near Alleghany, recently took out \$20,000 in a few days working.

The Fir Cap Mining Co., of Fir Cap District, took from their claim during the past week 400 ozs. gold dust, nearly \$7,000.

The Good Hope ledge is amazingly rich. The owners are now down 60 feet on the ledge.

## Siskiyou County.

*Yreka Journal*, Sept. 28th: The miners at Scott's Bar recently held a meeting to consider the propriety of allowing persons selling mining ground to Chinese. No definite action was taken on the subject.

## Yuba County.

Marysville *Appeal*, Sept. 26th: Rich quartz has been struck in one or two ledges at Brown's Valley that have heretofore barely paid expenses.

Sept. 27th: There are only four mines being worked at present at Brown's Valley, viz: Jefferson, Pennsylvania, Donnebroke and Rattlesnake. The main shafts of these claims have been sunk to the following depths: Jefferson, 650 ft.; Pennsylvania, shaft No. 1, 575 ft., and No. 2, 2,215 ft.; Donnebroke, 575 ft.; Rattlesnake, 165 ft.

## BRITISH COLUMBIA.

*Cariboo Sentinel*, Aug. 29th: Quite an excitement has been caused by the Butcher Co. on Red Gulch, who bottomed their shaft lately, and panned \$15 out of a portion of the dirt taken therefrom.

Sept. 2d: The last week's work at Williams Creek was as follows: California Co. 40 ozs.; San Francisco Co. 14 ozs.; Hibernia Co. 50 ozs.; Davis Co. 51 ozs.; Aurora Co. 190 ozs.; Ruby Co. 70 ozs.; and Prairie Flower Co. 50 ozs.

At Stont's Gulch during the week, Alturas Co. cleaned up 243 ozs.; Taft Vale Co. 67 ozs.; and Mneho Oro Co. 60 ozs.

In Conklin's Gulch, United Co. cleaned up 37 ozs.; Renfrew Co. 75 ozs.; and Reid Co. 55 ozs.

The Holman Co. on Mosquito Gulch, yielded 70 ozs. for the week.

In Red Gulch, a company called the Job Co. took out of their shaft five ozs. of very coarse gold, some of the pieces weighing from \$10 to \$12.

First Chance Co. at Lowlco Creek, took out during the week 120 ozs.

At Grouse Creek all of the companies are doing as well as usual. The Huron Co. took out 80 ozs. during the week, and the Caroline Co. 420 ozs.

Sept. 5th; Mr. Oliver Urquhart and his two partners have been out prospecting for several months past, returned on Monday evening, and reported the discovery of a creek in which they found gold in paying quantities. The creek has been named Mustang Creek. Urquhart and his party have located and recorded a discovery claim, about 500 ft. from the mouth of the creek, and have prospected it sufficiently well to know that they can make from \$12 to \$20 a day to the hand, and even more if there was a plentiful supply of water. There are a number of other creeks and gulches in the vicinity that look equally as well as the one referred to, which it is the opinion of our informant, who prospected some of them, will pay well.

**COLORADO.**

Denver News, Sept. 1st: There has been an exhibition at the First National Bank some fine silver bullion. One bar was from the works of Garrott, Martino & Co., 78 75-100 ozs., fine .915; value \$93.16 in coin. It was taken from 200 lbs. of ore from the White lode. The two buttons weighed 113 ozs., and were taken from 500 lbs. of ore from the Mohawk lode, by Prof. Johnson. Gen. Wilder also had about 70 lbs. of ore from the Mohawk lode, which he proposes to take on to New York. It assays \$10,000 per ton.

At the mint yesterday was to be seen 10 bars of gold bullion. Six of them weighed 455 80-100 ozs., value \$7,204.11. Two weighed 192 80-100 ozs., value \$2,879.46. The other two weighed 52 78-100 ozs., and were valued at \$814.99. This gives the total of 701 44-100 ozs. and \$10,890.56.

We were shown at the mint this morning, seven fine bars of gold, of an estimated value of over \$5,000. They had not yet been stamped.

At Cash Creek, a new flume company have just cleaned up \$2,900. Mr. Rickey has just taken out a nugget weighing 15 ozs. Capt. Hoyt & Co. are meeting with great success with their arrastras. California Gulch is paying well. Dr. Burt is taking out from an ounce to an ounce and a half per day to the hand. He lately found a nugget weighing 4 1/2 ozs. One has also been taken out of Iowa Gulch weighing five ounces.

Gen. Frank Marshall has sold to parties in Black Hawk, two tons of ore from the Square and Compass lode, for \$900 per ton.

Georgetown Miner, Sept. 12th: Mr. Minor yesterday assayed nine lbs. of ore, and obtained therefrom a button of silver weighing seven ounces.

An assay of gold ore from a lode near Central City was made by Mr. Miner a few days since, and the result gave \$1,700 per cord, from ore that yielded nothing under the stamp process.

Martine & Co. are now running on ore from the Coin lode.

From some specimens seen by the editor of ore from the Brother Jonathan lode, he pronounces it one of the very best silver deposits ever discovered so near the base of the mountains. It is a mixture of fine argentiferous galena with iron pyrites, and silver sulphurets.

Times, Sept. 5th: Yesterday the California Reduction Works cleaned up from the Smith & Parmelee claim on the Gregory. The bar was marked as follows: No. 101, gold .696 fine, silver .279 fine—77.30 ozs., value, gold \$1,112.15, silver, 27.91. Total, \$1,140.06 in coin. Average assay per ton of crushed ore, \$91.60.

Register, Sept. 11th: Messrs. Main & Rodman shipped this morning 1,500 lbs. of copper which was precipitated from the ore roasted by the Monnier process last year in Nevada. It is chemically pure, the gold and silver having been left in the residuum for amalgamation.

**IDAHO.**

Lewiston Journal, Sept. 12th: The Chinamen engaged in mining on the bars of the Snake, opposite Lewiston, are doing as well as could be expected. At one point they are making from \$1.25 to \$1.50 per day to the man, and at another they are making from \$1.50 to \$2 per day.

On Saturday last five Chinamen arrived from the Callville mines, on the upper Columbia, where they had been mining for the last 18 months. As the result of their labors one of their number realized the sum of \$1,100. The remaining four had about \$500 each.

Sept. 19th: A correspondent writing from Spokane Bridge, concerning the new mines at that place says: They are both rich and extensive. Several creeks have been struck that prospect well. One district, named Shot Gun Dist., prospects regularly 12 cts. to the pan, from three to eight ft. to the bedrock. The excitement in and about Bear Gulch is tremendous.

The Warren Diggings correspondent writes Sept. 6th: On the last day of August, the one-stamp mill belong to Sherwin & Myers was set in motion, and gave general satisfaction, making 78 strokes per minute. Mr. Sherwin has a small barrel amalgamator which Capt. Williams has been kind enough to show him how to construct, with the intent of saving the silver. Mrs. Wood panned out the first pan of rock that was crushed, and the result was \$7.75 in gold. The amount of rock panned was five lbs. There is on the ground about 1,500 lbs. of rock from the Winfield Scott, well roasted, which will be the first job of the mill.

**NEVADA.**

Virginia Enterprise, Sept. 25th: Mr. Isenbeck has exhibited to us two lots of clean amalgam from ore taken from the Snow Storm lead, Black Rock Dist. The two test lots, each of 250 lbs., were worked at the Stephenson mill—one lot being roasted and the other worked raw, Mr. Isenbeck's chemicals being used in working both lots. The exact result we will be able to give as soon as the bullion obtained is assayed, but it will go at least \$100 per ton. Mr. Isenbeck still has a considerable quantity of ore at the Stephenson mill. His plan of working is producing astonishing results. Day before yesterday he sent out to Washington Dist. a sufficiency of his chemicals to work 250 tons of ore. The cost per ton for chemicals by his process is about 20 cts.

Sept. 27th: Much interest is being manifested in the Black Rock mines. The ores from that region puzzle our best assayers, and in looking at them our old Comstock experts are ready to swear that they contain nothing, yet Isenbeck, the new manipulator, somehow manages to make them yield largely in silver and gold. Isenbeck and the Black Rock mines are either a very big thing or the biggest humbug yet heard of in Washoe. Let the experts decide.

**Pahranaagat.**

The Hiko correspondent of the Silver Bend Reporter of Sept. 28th, says: Mr. Iselin, who has been operating here since last June in our mines, has gone East. He has suspended all work on the mines under his charge here until his return. James Ostram is pushing work ahead upon his new mill, which, when completed, will for its capacity be equal to any upon the Pacific coast. He has just opened a large body of good ore in the Indiana ledge, and every one here is in ecstasies over his success.

Reville, Sept. 26th: The vein lately cut in the Indiana ledge is six ft. in width. The large vein is said to contain much excellent ore.

**Humboldt.**

Virginia Trespass, Sept. 30th: The Orena furnaces projected last season have been completed, and are now in busy and successful operation, smelting vast quantities of ore from the mine, and shipping the same to San Francisco. All the new machinery works to perfection, and the affairs of the company are in a most prosperous condition. A vast quantity of charcoal has been burned and is now at the furnaces; and there is ore enough mined to insure constant operations for many months. The ore averages over \$100 per ton, and the holders of the mine are absolutely assured of a magnificent fortune from the mine.

**Reese River.**

Reville, Sept. 23d: The prospects in Ione Dist. are just now encouraging. Many of the miners are taking out ore for the Knickerbocker mill, which will be opened immediately. The miners have agreed to furnish at least 10 tons per day for reduction. With both the Pioneer and Knickerbocker mills running, the Union Dist. will produce an amount of bullion that will attract attention and stimulate enterprise.

The mill of the Belmont Co. has been thoroughly overhauled and repaired by the

present proprietors. It has been improved and rendered more efficient by the addition of a capacious boiler, three of Belding's pans, two sotlers of his pattern, and a new cam shaft, tappets, etc. It began running with its new machinery last week, and produced an increased amount of bullion. The mill is reducing 10 tons of ore daily.

During the week ending Saturday, 12,616 ozs. of crude bullion were melted and assayed at the office of the Manhattan mill. This was the product of three days run of the mill, which was stopped for half of the week for the reception of new boilers. With those we may expect the mill to yield the usual product of 3,500 ozs. daily.

Sept. 25th: The mill of the Old Dominion Co. is working in the most satisfactory manner, and we shall soon receive a large shipment of bullion. The appearance of the Old Dominion mine of the company is said to surpass the most sanguine hopes of the enthusiasts in the district, and its development of rich ore is extraordinary. Several other mines are looking equally well.

Sept. 27th: Two teams passed through the city to-day with mill machinery for the Big Smoky Co., at Genova, Smoky Valley Dist.

Belmont Reporter, Sept. 28th: The California and Rhode Island mills at Austin, which have for a long time been idle, have been put in order and set at work again. The former has been leased by J. R. Murphy, and will be used for custom work, and the latter by W. E. Leon, Supt. of the Timoko, who will use it for reducing the ores of that mine.

A depth of 90 ft. has been reached upon the Champion ledge, Palmetto Dist., showing an unbroken vein six ft. wide heavily charged with mineral. Col. Catherwood has ordered his mill from Aurora, which will be erected at Palmetto without delay. There are a number of other ledges in the vicinity equally as good as the Champion, and next season great life and activity will prevail in that section.

**Washoe.**

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, Sept. 26th: Just at present a good deal of interest is manifested in outside claims—that is, claims "outside" or supposed to be outside, of the limits of the Comstock lead. The majority of the outside leads are old locations—veins located in 1860, '61. We firmly believe that many of these leads contain ore that will now pay well for crushing—though almost worthless when the regular price for the reduction of a ton of ore was \$30. The high price charged for crushing ores was the reason of the abandonment of hundreds of mines in this State in 1862, '63 and '64. Now that ores are being reduced for \$10 per ton many of our old mines are being reopened.

Sept. 27th: We were yesterday shown some very fine looking ore from the old Sutro claim, on the north side of Cedar Hill. The ore was taken out near the surface, and very much resembles the surface ore of the Gould & Curry.

Sept. 28th: During the week, Wells, Fargo & Co. shipped from their offices in this city and Gold Hill, 9,164 lbs. of assayed bullion, valued at \$219,210.10.

Trespass, Sept. 28th: The Ophir Co. has suspended work on the new shaft until the machinery, which was used in the old works, is in running order. The shaft has attained the depth of 75 ft.; but water came in so fast they could not keep it out and continue sinking with only a common whim. The new machinery will be ready to commence labor in about three weeks, when sinking will be resumed.

**OREGON.**

Salem Record, Sept. 10th: The Union and Santiam Cos. have accepted the offer of Messrs. Salmon & Co. to work their mines until June next. The terms are in fact "bedrock pay." They are to have certain wages, conditioned that the proceeds furnish the amount. All that is realized over and above the amount of wages, to be divided between them and the companies.

Rich discoveries have lately been made of gold bearing quartz in the Cascade Mountains, on the headwaters of the Umpqua. The Roseburg Esquig has accounts of silver ore having been recently discovered 40 miles east of that place.

Jacksonville Sentinel, Sept. 21st: The company in possession of the Alta copper mine, situated at the Low Divide, on the Crescent City road, have shipped about 700 tons of copper during the present summer. The ore is transported to smelting works in Massachusetts, near Boston, but it is the intention of the company to erect works in Smith River Valley, California—to which place they will have a road completed from the mine this fall, at a cost of about \$13,000.

**UTAH.**

Gold Hill News, Sept. 28th: The following is an extract from a letter written by J. W. Mills, a practical miner, formerly of Gold Hill and Austin, from the Sweetwater mines at South Pass. These mines, I think, will prove one of the best quartz regions ever found. There seems to be no end to the quartz—and good quartz at that. The ledges are generally large, say from one foot to 20 ft. thick, and mostly gold, with a slight trace of silver. The advantages for milling and mining are good, there being no end to the supply of wood. I will say to you, Charley, and your friends connected with me, that this place suits me better than any mining camp I have ever seen, or ever expect to see—for there is more good quartz in the space than I have ever seen in Nevada or California. If my judgment does not deceive me, it will surpass, in time, Gold Hill and Virginia City. I send you samples of ore taken from one of my claims, at a depth of 12 ft., where I cut the ledge at a thickness of six ft. It is all good quartz, which is believed can be made to yield from \$30 to \$500 per ton.

The sample of ore sent, as mentioned in the above, was assayed in Gold Hill, and yielded at the rate of \$100 in gold per ton.

## Notices to Correspondents.

**BRITISHER.**—Two centuries prior to the late Crimean campaign the French and English armies fought in alliance, as asserted by your Gallic disputant. The common enemy, on this occasion, was the Spaniard, then in possession of the fortified towns of Mardyke and Dunkirk, for the reduction of which towns the French and English armies were assembled in 1658. On the 3d of June, in that year, Condé, Don John of Austria, and the exiled Duke of York (afterward James II. of England), headed an attack to relieve those places; the besieging army being commanded on the part of the French by the celebrated Turenne, and the English by General Lockhart. A pitched battle was the consequence, the account of which forms a prominent part of every moderately extended French history, in which it is described as the Battle of the Dunes, in consequence of its having been fought among the long row of sand-hills eastward of Dunkirk. It is only very copious English historians, however, who notice this pitched battle, although so prominently dilated upon by Gallic historians, of which Sismondi has given a good abridgement, in which he describes, from French authorities, the sanguinary and obstinate nature of the combat on the fortified ridge of the principal sand-hill stormed by the English, who there began the battle, and astonished both their Spanish opponents and their French allies by the resolute and persevering obstinacy with which they struggled through the natural difficulties presented by ascending a loose sand-hill, and then fought at the summit, when it was surmised they would have found themselves exhausted by the labor of the ascent. The allied armies were victorious, and the chief honor attendant on the victory by contemporary French writers was cheerfully awarded to their English friends. It may, perhaps, not be much out of place to mention, in addition to the foregoing particulars, that the modern English word *dunes*, as applied to hills of low or very moderate elevation in the south of England, is a corruption of the word *dune*, which itself most probably is a derivation of the Celtic word *dun*, or a low hill. Thus Dunkirk, a compound Saxon and Celtic term, would mean the church on the hill. Southdown, or Down mutton, has long been and still is extensively celebrated; by none, however, was it more esteemed than by Charles II., especially that fed on Banstead Down, in near proximity to the world-wide celebrated Epsom race ground—a fact which gave origin to Rochester's pungent but impromptu epitaph, given at the "Merry Monarch's" own request. We republish it because we do not think it is very generally known among our readers, and perhaps will serve to amuse, and thus vary sometimes or enliven some monotonous employment or care. We agree with the adage, that "all work and no play made Jack a dull boy," so here is the epitaph:

"Here lies the man to eating long,  
Who's word no man could out-  
Wh never said a foolish thing,  
Nor ever did a wise one."

## The State Capitol.

Large numbers of people, from various parts of the State, embraced the opportunity of their visit to the recent State Fair, at Sacramento, to take a look also at the State Capitol. Their visits were generally made all the more pleasant and profitable, because of the attention and courtesy of the architect, who, whenever it was in his power, took especial pains to explain the plans and progress of the work. The noble proportions of this magnificent structure are now rapidly being developed, and so far has the work advanced since our last notice of it, as to merit especial attention from all interested in the prosperity of our young and rising State. All intelligent tax-payers, in observing the progress which is being made in this work, must become fully aware of the good use to which their money has been put in the progression, thus far, of this magnificent building.

From the architect, Mr. G. P. Cummings, we received a lucid and full description, explanation of plans and future projections, as the work advances. He gave us, also, many interesting particulars connected with the history of this and other large buildings of its kind, from which we learn that in the aggregate of style, size and imperishability of material, there is but one building on the continent which will be its superior, and only that one its equal. The building covers, with its angles, nearly 60,000 surface feet, and from its present ground line will be 226 feet to top of the dome, the circumference of which, at the roof, will be 267 feet, with an area of 5,600 feet at the lower balustrade, or promenade.

It will be remembered that contracts had been made by the Commissioners, under the Acts of former Legislatures, to finish the basement, or story under the columns, with granite. Although the contracts were broken, the work continued under all the disadvantages, and has just been completed, as we saw the last stones of the south portico placed during our visit. The stonework, which has dragged its slow length along for six years, makes a fine appearance, however, particularly the two elegant doorways on the east facade; nor will the more light and stylish architecture of the upper stories, which are to be finished in iron, brick and cement, detract, in any measure, from the solid beauty of the basement, more particularly as the granite will be painted the color of the sanded mastic—an improvement that will remedy its only apparent defect—the stains upon it. The granite seems to have been experimented with, as there are two kinds, but both totally unfit to carry out the florid architecture of the building, as a material in the upper parts. Nor does the measure appear to have been decided by any Legislative Acts; but the credit of the decision to change to a more practical, stronger, and not one-fourth as costly material, rests with the present Board of Commissioners, and more particularly with our present clear-sighted, straightforward, practical Governor.

As a people and as Californians, one of our virtues is not patience, especially when, in addition, we should be taxed for some ten or twelve years more, nearly or quite \$200,000 per annum, and even then would have been compelled to resort to iron, or soft stone, for a finish, as the architect informed us he knew of no instance of a corinthian capital being cut in granite.

The progress and mode of operations on the building are very perfect and economical; every man has his place, and must be always there. The mortar is made in a horse-power machine, and brought on railroads through the dome, and, like all the other material, hoisted through the rotunda by a succession of stagings and spars, the upper one of which is seventy feet long. Two other derricks are in use, and the entire floor is covered over its massive arching with tramways, etc. There are about

140 men engaged on the building, and the second story will soon be completed.

The beauty of the castings from the Miners' Foundry, of this city, are universally spoken of and commended; and the effect of the parts built in, particularly the Venetian arcade of the rotunda, with the symbols, bear's heads, etc., form the perfection of iron architecture.

It is not within our present limits to give a full description of the building. The designs of the legislative halls, library, dome, etc., which, with the eastern facade, are the work of the present architect, are in strict harmony with the other parts of the building, and like it are faultless in ornament and proportion. The so much talked-of fissures in the walls have disappeared from the remedies applied to them, and the heavy iron bars and powerful anchors that are carried through all the porticos, seem to render a fissure impossible, in a building as strong as iron and stone can make it.

## Fourteenth Annual State Fair.

(Continued from last week.)

**The Pacific Oil Works.**—The exhibit made by this company—L. B. Benchley & Co., agents—represented an entirely new branch of industry on the Pacific coast, which has been introduced and carried forward to success since the last annual exhibition. The interest here represented is a most important one, and if carried out to its legitimate limits will furnish a field for the employment of a large amount of capital, and add quite as largely to the agricultural industry of the State. The company exhibited raw and boiled linseed oil and oil cake, California paint ground in oil; also castor oil and mustard seed oil. This company has fully proved our capacity not only to produce all of these articles for home consumption, but it has also shown that by means of the great productiveness of our soil we can manufacture them for export. The great and immediate advantage which the State must derive from the establishment of these works, is the ready market which they afford for the sale of the various seeds employed in the manufacture of these oils—thus giving our farmers an opportunity to commence their production in a small way, and gradually increase that branch of their business as experience and means may warrant. A special premium was awarded for this exhibit.

**Knit Goods.**—Another most important and entirely new branch of industry, for the first time placed on exhibition on this coast, was the superb display of knit goods—all wool and wool and cotton—by the Pacific Woolen Mill, located near the Mission, in this city, a full description of which we gave in our issue of the 14th ultimo. Though an institution of only four months existence, it was nevertheless able to place on exhibition not less than fifty samples of goods, embracing almost every description of knit goods known in the market, and at least one article of this description of manufacture now for the first time introduced—a heavy *knit* woolen skirt—an entirely new thing in its way, and which has very properly been christened the "Pacific Excelsior Skirt." It is made of all shades of colors, and is intended for winter wear. The great feature of this establishment is the variety and superior quality of its goods. Its manufactures exceed, in variety, by almost one-third that of any similar establishment at the East; while in quality, the superiority of its goods are readily manifest to every person who will compare them with similar goods of Eastern make. They can also be afforded at a lower price than Eastern goods. This advantage is obtained from the fact that they can purchase their raw material direct from the growers, saving the cost of transportation of the same to New York and that of the manufactured goods back, with interest, insurance, etc. The saving in this respect is more than a counterbalance for the difference in cost of labor. The amount of this description of goods consumed on this coast reaches a large figure. We shall give some statistics on this point at a future time. Perhaps no exhibition at the Pavilion attracted more interest than this. The Committee on Awards recommended for the display a first premium of \$50.

**Woolen Woven Goods.**—The Mission Mills. The display of woolen woven goods was highly creditable to that important interest. The Mission Mills of San Francisco, made a really fine display. The blankets, especially, attracted a flattering share of attention, both as to variety and quality. It is a most interesting fact, and one which should be remembered, that this company

makes the finest blankets on the continent. Their goods have never yet been equalled by any establishment in the Atlantic States. Such is the universal verdict among New York dealers. The award at the Paris Exposition, also gives them the credit of the finest exhibition of blankets from America. A special advantage is claimed by this company in the matter of colors, to the brilliancy and durability of which especial attention is paid. Their flannels and fine cloths, especially their ladies' cloak goods and stuff for officers' wear, were pronounced quite superior. They were awarded a first premium of \$50 for the best display of woolen goods from one manufactory; also first premiums as follows: Ten yards woolen cloths, \$5; ten yards cassimeres, \$5; ten yards flannel cloth, \$5; pair woolen blankets, \$5.

**The Pioneer Woolen Mills,** the first enterprise of this kind undertaken on the Pacific coast, also made a very full and most excellent display of goods. Their general display of manufacture and fabrics was said by competent judges to compare very favorably with the best articles in the same line of either Eastern or foreign make, and like the productions of all the woolen manufactures on this coast are furnished to the consumer at a price as low or lower than the same class of goods can be laid down here from New York or any European port. This establishment manufactures a large amount of flannel goods, which are made up on their premises into shirts, drawers, etc.—some 70 sewing machines being employed for the purpose. One of the most attractive exhibitions at the Fair was a loom for weaving fancy colors, which was set up by this company on the lower floor of the Pavilion, and run every day and evening during the continuance of the exhibition. This loom combined all the latest improvements for manufacturing fancy goods, flannels, cassimeres, etc. The Committee of Awards in their report, called especial attention to the loom, and recommended for it a special premium. In addition thereto, the Committee also awarded a first premium for their display of woolen shirts and drawers, and a further premium of \$5 for an exhibit of ten yards of tweed of their manufacture.

**Cotton Manufacture.**—William H. Rector & Sons, of the Oakland Cotton Factory, added a new and additional article of manufacture to their display of last year, in the shape of water-proof tweed, for ladies' and gentlemen's wear, also samples of a heavier article for laborers and boys' clothes. This company claim to have introduced goods into this market of greater utility for their cost than any other manufacturers on the coast. They have recently commenced manufacturing their goods into clothing, thus giving employment to a much larger number of persons than the simple manufacture of the goods would do, and supplying our market with a large and important class of clothing for which we have heretofore been entirely dependent on the Eastern market. They also exhibited in addition to ordinary cotton goods, an article of sheeting made expressly for flour sacks—also brown drilling of a superior quality. The Messrs. Rector are deserving of much credit, and the fullest measure of encouragement for their efforts, in the face of obstacles, to establish a new and important branch of manufactures on this coast. They were awarded a first premium of \$50 for their display.

**Silk and Silk Goods.**—There seems to be a peculiar and growing interest manifested in the gradual development of the silk interests on this coast. Mr. L. Prevost, the enthusiastic and irrepressible pioneer in this branch of industry, was on hand with his collection, commencing with the silk worm's eggs, and from these showing the worms of all sizes feeding; then the cocoons, and again the millers ready to lay their eggs. From this point the equally indefatigable Mr. Newman took the cocoons to a reel of his own invention, where he reels off, before the visitors, the raw silk, and exhibits the same in hanks, or transfers it to his silk loom, which is exhibited by the side of his reel, and where he shows the slow and tedious process of silk weaving, gradually unfolding to the vision the rich, glossy and rustling silk, ready for the dressmaker to transfer into superb robes for our wives and daughters! We have no space in this report to do even an iota of the justice which belongs to this, which we sincerely believe is to become the great and crowning glory of the production and manufactures of our Golden State. In the words of the committee to whom this exhibit was referred, "We feel it our duty to congratulate the people of California on the evident progress which has been made the past year in this State in this most important branch of industry. We are confident that this progress is not ephemeral, but is the result of practical knowledge on the part

of enturists and manufacturers, and that a new and profitable source of labor is to be firmly established among our people, to their moral and pecuniary benefit, and that the representatives of silk culture at the State Fair of 1868 will convince the most skeptical." A first premium of \$50 was awarded to Mr. Prevost for the best general exhibition of the silk business throughout; the first premium of \$20 to Mr. Newman for the best specimen of manufactured silk; of \$10 for the best specimen of raw silk, and a first premium of \$10 for the best cravat; also, the first premium of \$10 to Mrs. Muller, of Nevada City, for the best pound of reeled silk made in a family. We shall at a future time speak of some other important matters connected with the silk business, in which Mr. William M. Hoyne, of Sacramento, is taking a most active part.

**Glass Ware.**—The display of glass ware by Messrs. Newman & Brennan, of the *San Francisco Glass Works*, would have done credit to any city in the Union. This company, until recently, have confined their attention to the manufacture of white glass exclusively—turning out large quantities of druggists' prescription vials of all sizes, from half an ounce to sixteen ounces; also patent medicine bottles, sampling bottles, lamp chimneys, etc. They have the Government contract for lighthouse lamp chimneys. They exhibited a most interesting and unique specimen of fancy glass work, in the shape of a single bottle with twelve compartments, from which as many different liquids might be found. It would be considered a rare specimen of the skill of glass-blowing in any place in the world.

Mr. Newman, senior member of the firm, exhibited one of his patent glass pots, which he has recently patented through the *MINING AND SCIENTIFIC PRESS PATENT AGENCY*, and by the use of which the Company has been enabled to successfully introduce the manufacture of colored glass into the same furnace with that partially employed in making white glass—thus adding to the scope of their manufacturing capacity, without any extra cost or inconvenience to their other business. The invention of this pot is the first important improvement which has been made in this direction for the last six or eight hundred years. This invention possesses many points of merit, the most of which have already been fully described in the columns of the *Press*. The committee recommended for this invention a special award for its great merits and its being a California invention.

The committee also, in view of the very great risk and expense attending the introduction and manufacture of white glass, and the large commercial value which it has added to the State and Pacific coast, recommend that, in lieu of the special premiums, an award of either the gold medal belonging to the third department, or else a special gold medal be awarded to Messrs. Newman & Brennan.

The *Pacific Glass Works*, of this city, John Taylor, agent, had also on exhibition a large variety of their ware, consisting mostly of colored glass, in the shape of soda bottles, wine and brandy bottles, patent medicine bottles, etc. This is the first extensive glass manufactory erected on the Pacific coast, and as such is entitled to most important consideration as a pioneer in this important branch of industry. The company have confined themselves almost exclusively to the manufacture of colored glass, and have been the means of early filling a most important necessity growing out of our distant and isolated location, which rendered the importation of such brittle articles as are made of glass extremely difficult and expensive from breakage. The goods exhibited by this company were all superior of their kind.

**USEFUL PUBLICATION.**—J. H. Carmany & Co., of the *Weekly Stock Circular*, have issued a very neat diagram of the room of the San Francisco Stock and Exchange Board. The diagram is about 14 by 20 inches in size, and displays distinctly every desk, 80 in number, with the name of its occupant on the first of October, plainly marked upon it. A list of officers and members of the Stock Board is also given, with the place of business of each member. A scale of commissions is also added, together with the hours of morning and afternoon sessions. The San Francisco Stock and Exchange Board was organized Sept. 11th, 1863. Its present officers are J. E. B. Cavalier, President; A. H. Lissak, Vice-President; Geo. W. Smiley, Caller; Franklin Lawton, Secretary; Henry Schmiedell, Treasurer. The present number of members occupying seats is 78—there being only two vacancies.

W. WALLACE WEBSTER,  
Boston.

J. BERTRAM WEBSTER,  
Stockton, Cal.

**WEBSTER BROTHERS,**

IMPORTERS AND DEALERS IN

WEEKES S.F.

**Agricultural Machines, Steam Engines, Hardware, Cordage,**

OIL, Etc., Etc.

**Stockton Agricultural Warehouse.**

WEEKES S.F.

**Baxter's Patent California Gang Plows--3, 5 and 6 Plows to a Gang.**  
COMPLETE WITH SEED-SOWER.

Adapted to soils in all parts of the State. The simplest, cheapest and most effective Plow in the world.

10v151-2t

**NORTH AMERICA  
Life Insurance Company.**

Usual Restrictions on Occupation and Travel  
**ABOLISHED!**

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!  
**J. A. EATON & CO.,**  
Managers Pacific Branch, 302 Montgomery st.  
23v14nr9n SAN FRANCISCO.

Jacob Suw, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street), takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14tf

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 5v15tf

BUSINESS NOTICE.—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK OAK-LERY, Nos. 23 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v15qr B. F. HOWLAND, Artist.

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with *PAIN KILLER*—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 6v14-ly AUSTIN A. WELLS, Agent.

**Perry Davis' Vegetable Pain Killer.**

We clip the following from the Providence (Mass.) General Advertiser:

"At this season of the year, when cholera, cholera morbus, dysentery, and other kindred complaints are sure to prevail, everybody should be liberally supplied with Perry Davis' Vegetable Pain Killer. Persons leaving home, whether it be for a day's excursion or a trip to Europe, should be in a condition to place their hands upon it at a moment's warning. Many diseases incident to the summer months, which will prove fatal if not immediately checked, can be promptly cured by one or two doses of the Pain Killer. On more than one occasion we have been relieved of intense suffering by the timely use of the above named preparation."

Sold by all Druggists, Grocers and Medicine Dealers everywhere. 10v15-1m

**NOTICE TO CREDITORS.**—IN THE PROBATE Court of the City and County of San Francisco, State of California. Estate of HENRY GANAHL, deceased. Notice is hereby given by the undersigned, Administrator of the above natural estate, to the creditors of, and all persons having claims against said deceased, to exhibit the same, with the necessary vouchers, within ten months from the first publication of this notice, to the undersigned at his office, No. 23 Court Block, 636 Clay street, San Francisco. Dated October 31, 1867.

ANOREW D. SMITH,  
Administrator of the Estate of Henry Ganahl, deceased. 14v15-4w

No. 600 Sacramento street, two doors above Montgomery, SAN FRANCISCO.

**TEA, WINE AND SPIRIT MERCHANTS,**  
IMPORTERS AND WHOLESALE DEALERS IN FINE Brandy, Whiskies, Gins, Port, Sherry and Champagne Wines, Ale, Porter, Claret, Bitters, Cordials, Syrups, etc., for medicinal and family use, and supplies to families, apothecaries, physicians, city and country dealers, hotels, clubs, etc., in large or small quantities. Observe firm name on each cork and fac simile of signature on label. Trade mark registered. This is the only exclusive Tea, Wine and Spirit Store on the Pacific coast. It is neither a saloon nor sample room (as no wine or spirits are allowed to be drunk on the premises); but a depot where selected Teas and Pure Wines and Spirits may be found, at wholesale and retail, for medicinal and family use. In this respect it is our aim to vie with Bininger & Co., of New York, Biglow & Davis, of London, and Cozzens & Co., of Washington, where every facility is offered to ladies, as well as to gentlemen, in making their own selections and purchases in quantities to suit. Our Treatise on Wines, Spirits and Teas may be had at our depot gratis, and will be mailed to consumers and dealers in the interior when requested. WHITING & BERRY, 609 Sacramento street, 2d door from Montgomery, San Francisco. 14v15

OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street. FIRE AND MARINE INSURANCE. 10v149pqr

LEWIS FALKENAU, HENRY G. HANKS.

**Pacific Chemical Works,**  
Laboratory, Sixteenth street, near Folsom. Office, 623 Montgomery street, San Francisco.

**FALKENAU & HANKS,**  
MANUFACTURING AND CONSULTING CHEMISTS.

Particular attention given to the analysis of Ores, Minerals, Metallurgical Products, Mineral Waters, Soils, Commercial Articles, etc. 14v15

**It is a Fact**

That BOWMAN'S AMERICAN WASHING COMPOUND is the best article for Washing and Cleaning yet discovered. It is acknowledged to be a saving both in money and labor. As the compound softens the dirt, the clothes require not more than one-half the rubbing necessary in washing by the old method, besides all who give it a trial acknowledge that their clothes are whiter in washing with this compound than they were ever known to be by using any other preparation. For washing woollen goods and handkerchiefs, it cannot be equalled. Clothes that cannot be washed with soap without fading are washed in the water used for boiling white clothes. This Compound has been used in the Eastern States for the past three years, with perfect success.

WARRANTED NOT TO INJURE THE CLOTHES. For sale by all Orceers. LYNCH & PARSONS, Agents. 14v15-3m 222 Jackson street, near Battery.

**ROOT'S Patent Force Blast Blower.**

Adapted for Smelting, Foundry, Mining and Steamships.

Requires 50 per cent less power than any Blower now in use. For further particulars, address KEEP, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15f19p

**Oakland College School.**

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address, I. H. BRAXTON, Principal. OAKLAND, California. 5v15qr9p.

**LINSEED OIL.**

**The Pacific Linseed Oil & Lead Works**

Are now prepared to furnish dealers and consumers Pure Linseed Oil,

Raw or Boiled, at the Lowest Market Rates. We call especial attention to the quality of our Oil, believing it to be superior to any imported Oil offered in this market. Also, Oil Cake Meal, the best article known for fattening stock and increasing the product of milk.

Cash paid for Castor Beans and Linseed, on delivery at the factory. Address,

Pacific Linseed Oil and Lead Works, Care of L. B. BENCHLEY & CO., 19v14-3m9p San Francisco.

**PACIFIC Rolling Mill and Forge Co.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of RAILROAD AND OTHER IRON

Every Variety of Shafting Embracing ALL SIZES of Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames.

ALSO—HAMMERED IRON Of every description and size.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention. The highest price paid for Scrap Iron. 9v14m9p

**DR. FONDA'S San Francisco Eye Infirmary.**

Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years principal of the Lafayette (Ind.) Eye Infirmary. F. W. FONDA, M. D., Surgeon in Charge. Office, 428 Montgomery street, opposite Well, Fargo & Co's. 4v15-19p

**AGENTS WANTED.**

MINERETIC MEN OR WOMEN CAN MAKE MONEY in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v15qr9p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Goiding Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Case, Jones & Wheeler's improved flat bottom pan, Beldin's pan, Yeatch's tubs, Frater's concentrators, Wake's pans, Beers' pan, Corning Barrels, Astra Gearing, Gillo Mills, Settlers of all descriptions, Rotors of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety in Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**MASSACHUSETTS EMERY.**—The Chester emery mine, located in Chester, Hampden county, Mass., has now been in active operation about one year, and is steadily increasing in production and prosperity. Nearly a ton of refined emery for each working day is being manufactured. A large collection of the best samples of the emery in every stage of its manufacture, and specimens of all the associated minerals in the mine, were prepared and forwarded to the Paris Exposition.

The Heidelberg tun, heretofore the largest cask in the world, is now eclipsed by one on exhibition at the Paris Exposition, which holds upwards of 20,000 gallons—600 barrels. The length of this enormous cask is 18 feet, and its diameter 20 feet; it is encircled by no less than 28 iron hoops.

The railroads in America employ 200,000 men, and at least 1,000,000 men, women and children depend wholly for their support upon the railroad interest.

**TOWNE & BACON,**  
Book and Job Printers,  
Have the Largest Office,  
Do the most work,  
And do it better  
Than other offices  
In this City,  
**536** Try them  
With a Job,  
And you will be  
Satisfied the above  
Statements are facts.  
Their office is at 536  
Clay St., below Montgom'y,  
Over Pacific Fruit Market.

**Machinists and Foundries.**  
**PALMER, KNOX & CO.,**  
**Golden State Iron Works,**  
Nos. 19, 21, 23 and 25 First Street,  
SAN FRANCISCO.  
MANUFACTURE ALL KINDS OF  
**MACHINERY,**  
**STEAM ENGINES AND QUARTZ MILLS**  
DUNBAR'S IMPROVED  
**Self-Adjusting Piston Packing,**  
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.  
**WHEELER & RANDALL'S**  
**NEW GRINDER AND AMALGAMATOR**  
HEPBURN & PETERSON'S  
**AMALGAMATOR AND SEPARATOR,**  
**Knox's Amalgamators,**  
WITH PALMER'S PATENT STEAM CHEST,  
Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.  
**Genuine White Iron Stamp Shoes and Dies**

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver.  
**WILLAMETTE IRON WORKS,**  
PORTLAND, OREGON.  
**Steam Engines, Boilers,**  
**SAW AND CRIST MILLS,**  
MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

Sacramento.  
**WILLIAMS, ROOT & NELSON,**  
MANUFACTURERS OF  
CROSS' PATENT BOILER FEEDER,  
**STEAM ENGINES, BOILERS,**  
And all kinds of Mining Machinery.  
Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.  
**Dunbar's Patent Self-Adjusting Steam Piston Packing,** for new and old Cylinders, manufactured to order.  
Front Street, between N and O streets,  
14v11 SACRAMENTO CITY

**Pacific File, Reaper and Mower Section**  
MANUFACTORY,  
No. 53 Beale Street, between Market and Mission,  
SAN FRANCISCO.  
Files re-cut and warranted as good as new, or no charge. The only establishment in the State. We also manufacture Reaper and Mower Sections.  
1v 11 RIDDELL & DURNING, Prop'rs.

**GLOBE**  
**Foundry and Machine Shop,**  
STOCKTON, CAL.  
**KEEP, BLAKE & CO.,**  
MANUFACTURERS OF  
**Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,**  
Mining and Irrigating Pumps, Car Wheels, Derrick Irons, Hoise Frots, Iron Fencing, Balcony Railings, etc., at San Francisco prices. Orders solicited  
18v13-ly and promptly executed.

**GEORGE T. PRACY,**  
**MACHINE WORKS,**  
Nos 109 and 111 Mission street, between Main and Spear,  
SAN FRANCISCO.  
**STEAM ENGINE, FLOUR AND SAW MILL**  
And Quartz Machinery, Printing Presses,  
—AND—  
MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.  
Special attention paid to Repairing. 18v13-ly

**SAN FRANCISCO**  
**Foundry and Machine Works,**  
N. E. Cor. Fremont and Mission streets,  
Manufacturers of  
**Marine and Stationery Engines**  
Quartz Machinery, Saw, Flour and Sugar Mills, Mining Pumps, Hoisting Gear, Agricultural Implements, etc.  
—ALSO—  
**Wine, Cider, Cotton and Tobacco Presses**  
of the latest Improved Patterns.  
**STEAM ENGINES AND BOILERS,**  
Of all sizes, constantly on hand; Quartz Mill Shoes and Dies warranted to be made of the best white iron.  
**Dunbar's Improved Self-Adjusting Piston Packing,** requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.  
**MACHINERY OF ALL DESCRIPTIONS**  
Bought, sold, or exchanged. Bolt Cutting and Castings at the lowest market rates.  
6v11-ly **DEVOR, DINSMORE & CO**

**LEWIS COFFEY,** J. S. DON  
**LEWIS COFFEY & RISDON,**  
**Steam Boiler & Sheet Iron Works.**  
THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality.  
Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

**CALIFORNIA BRASS FOUNDRY.**  
No. 125 First street, opposite Minna,  
SAN FRANCISCO.  
ALL KINDS OF Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Belts and Gongs of superior tone. All kinds of Cores and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.  
PRICES MODERATE.  
V. KINGWELL, 18v13-ly J. H. WEED.

**HANSCOM & CO.,** { PENDERGAST,  
R. S. SMITH. } { W. W. HANSCOM.  
**Etna Iron Works!**  
Southeast corner Fremont and Tehama streets,  
SAN FRANCISCO.  
Practical Machinists and Iron Founders,  
MANUFACTURE  
**STEAM ENGINES,**  
QUARTZ MILL MACHINERY OF ALL KINDS,  
**SAW MILLS, FLOUR MILLS,**  
**Dunbar's Improved Self-Adjusting**  
**PISTON PACKING,**  
Now so extensively used in the East and in this State. Requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.

**HANSCOM'S CRUSHER,**  
The best of the kind now in use in this State or anywhere else;  
**Wheeler & Randall's New Grinder and Amalgamator,**  
Which only needs examination to be appreciated.  
**Tyler's Improved Water Wheel,**  
Giving greater power, at lower cost, than any wheel in use. Send for one of our circulars, giving full tables.  
All Wheels warranted to give the power as set forth, or the money will be refunded.  
**Sole makers for this coast of the "Pendergast White Iron Stamp Shoes and Dies."**  
None genuine unless obtained from us. Every one warranted.  
Patented Machinery of all kinds will be furnished by us at market prices. Particular attention given to drawings and specifications of machinery, which will be made to order. The patronage of the public is respectfully solicited.  
18v12

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 26v12-5m

A SIMPLE HAND LOOM, suitable for weaving jeans, blankets, tweeds, satinet, towel, diaper, carpeting, and plain cloth, has been recently invented by J. & H. Henderson, of Keokuk, Iowa. The sewing and the knitting machines have now quite generally been established as desirable conveniences in a large number of households throughout the land; while the loom, which once held such a conspicuous place in most families, has entirely disappeared, as a medium of home industry. There is no doubt but that its use would be a matter of both economy and convenience in many localities, even in the presence of power machinery. The unwieldy and cumbersome machine formerly employed, however, is not the thing for modern use. Much inquiry has recently been made for a neat, simple and compact loom to be placed by the side of the sewing and knitting machine; and it is claimed that the above invention supplies that want quite fully. The next need is an improved spinning machine, to take the place of the old-fashioned "wheel;" and a carding machine, even, would not be out of place in a large and well-regulated household. Such kinds of machinery are great promoters of industry, health, wealth and true social progress.

The Russian Government has sent an order to the United States for 100,000 Berdan rifles.

**FARMERS' AND MECHANICS' BANK OF SAVINGS.**

225 Sansome street, near California.

Incorporated under the Act of the Legislature of California, approved April 11th, 1862.

CAPITAL STOCK, : : : : \$150,000.

**DIRECTORS:**

N. G. Fassett, George M. Condee, Reuben Morton, H. H. Wheeler, Isaac E. Davis, James Lathley, Henry Dutton, B. H. Freeman, Samuel I. Palmer, G. H. WHEELER, Cashier, N. G. FASSETT, President.

Deposits received in gold, silver or currency, payable in like kind, at sight. Funds may be sent by express, or in registered packages by mail. Receipts will be promptly furnished.

We will receive Gold Dust and Bullion, for refining or assay; make advances on the same, and return proceeds promptly.

Best Bankers' Drafts, on all parts of the world, furnished at lowest rates, by addressing us. Write names plain. Checks of all banks taken.

Money loaned only on first-class security, safely being our first consideration.

**FIRST Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.** It is for all exposed surfaces impervious to wet, will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Ice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years will keep it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

**NEW CLOTH ROOFS** put on, copings and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—for eight dollars per one hundred square feet. **NEW OIL OLD TIN ROOFS** cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Goswell, Tabbis & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis's building, 88 feet front, on Folsom street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Goswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

**ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT** is composed of India rubber and other gums, dissolved in kerosene oil, mixed with the various coloring matters, and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

**EPES & E. H. R. ELLERY** are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used. Address Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6 1/2

ESTABLISHED [MAY, 1860.] VOLUME FIFTEEN — OF THE — Mining and Scientific Press, COMMENCING JULY, 1867. DEWEY & CO., Publishers.

Issued every Saturday, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, SAN FRANCISCO. Terms to Advance.—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5.50 per year, or 55 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

The MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors, Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 Clay street, San Francisco.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

MOSHEIMER'S PIONEER MINING SCHOOL AND Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches: 1. Assaying of ores, metals and other mineral substances. 2. Technology, or Chemistry, as applied to any special branch of manufacturing. 3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5. Concentration. Dressing of ores. 6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology.

Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore, learn first, if you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful. It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. My years of actual experience in the laboratory, smelting works, quartz mills, and other manufacturing carried on on my own account, have not only given me lessons, but more than ordinary ability.

I was the first one in California who successfully extracted silver by smelting, on a large scale, and have since been travelling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process.

I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works.

My lately invented Roasting Furnace has the following advantages:—Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and easily takes up the chlorine gas or quicksilver when amalgamated. A large size furnace, in successful operation may be seen, by permission of Mr. Wainman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores, \$3 00 Copper ores, 6 00

Practical Chemist, Metallurgist, etc. Office, No. 328 Montgomery street, San Francisco, Cal. 6v15-3ms

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Yreka Union.

Notes of Travel. THE NEW MINT AT CARSON.

EDITORS PRESS: We left Dutch Flat on the morning of the 18th, via Donner Lake, and Lake Tahoe, for this place. The most noticeable feature was the continuous line of work from Cisco to Coburn's station on the Pacific Railroad...

Passing for some distance along the northern and eastern shore, we were pained to see that the lumbermen, those thoughtless iconoclasts of primal beauty, at favorable points, were marring the unbroken beauty of its ever varying scenery.

As a great natural curiosity, at a point about a mile from the "Griff House," just at the water's edge, hot water comes bubbling up, charged with sulphurous odor. We plunged our hand in, but withdrew it as quickly, to prevent scalding. As a geological feature, we observed that on the lake side, and extending out into it, was lava or pumice of volcanic origin...

THE MINT AT CARSON. By the politeness of Mr. A. Mitchell, foreman, as also of Mr. A. Curry, superintendent of construction, we were furnished very full particulars of this public work.

The size of the mint is 90 feet front by 58 feet deep; portico in front, 12 feet; an engine house in the rear. Height of basement, 9 feet; of first story, 15 feet; second story, 14 feet; attic, 9 feet; with an observatory 14 feet square, and 17 feet in height; whole height, including flooring, 61 feet.

The material of which it is constructed is coarse sandstone, granitic in character, quarried within the prison enclosure, which is located about two miles distant.

The second story is nearly completed. To provide against fire, the floors are covered with lime mortar one inch thick, and the second flooring laid over it. Stairways are of granite, of fine quality. Windows arched, basement arched and grained, main chimney stack, 80 feet in height, with base 10 feet square. The building will be ready for the roof in six weeks.

The machinery is being prepared, and it is expected that it will be ready for operation some time next spring or summer. Its dimensions are ample, structure solid, and will, when completed, supply a pressing demand for a vast region on the eastern slope of the Sierra.

Carson boasts a population of 2,500, is mainly indebted for its size and prosperity to their mining interests.

Tenabo, fourteen miles south, has a population of about 300, subsisting on its agriculture. M. F. Genoa, Sept. 10, 1867.

INDIAN SKILL.—It is said the Indians have a very ingenious way of setting fire to houses with their arrows. They wrap with a rag some powder on the head of their arrows, and on the tip of the arrow-head place a percussion cap. When the arrow strikes the house, the cap is exploded and the powder and rag ignited. The rag burns long enough to set on fire any combustible with which it may come in contact.

GRAPE SEEDS FOR COFFEE.—It is said that in many parts of Germany the seeds of grapes are frequently used in place of the coffee berry. When pressed they yield a quantity of oil, and afterwards, when boiled, furnish a very economical, and, it is said, a very delicious substitute for the genuine Mocha.

NEW USE FOR POULTRY.—A Frenchman has devised a vehicle which he has fitted up with nest boxes, perches, etc., which he proposes should be kept on every farm, well filled with fowls, to be transferred every day to the spot where the most active farming operations were being carried on.

FISH BISCUIT.—Prof. Rosing, of Asa, in France, is said to have devised a process of making flour from a species of sea fish, which he forms into biscuit, thereby providing a very nutritious and compact species of food.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 29, 1867. TERMS— tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles, Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$350.

The Commercial Herald —AND— MARKET REVIEW

Will be issued early on EVERY STEAMER-DAY MORNING. (TRI-MONTHLY). Office—Southwest corner Washington and Battery streets, Opposite Post Office and Custom House.

The HERALD will contain full and reliable commercial details, and elaborate articles on the monetary affairs of the Pacific Coast. The Letter Sheet Market Review, Containing selections from the COMMERCIAL HERALD, printed on tissue paper, for transmission abroad, will be published simultaneously with that paper.

Weekly Stock Circular. Merchants can have their cards prominently inserted in the Letter sheet MARKET REVIEW.

THE CENTRAL PARK OF THE PACIFIC. Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, —AND— ZOOLOGICAL GARDENS. A GRAND INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays a GRAND CONCERT OF SACRED MUSIC, appropriate to the occasion.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast. The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Picnic.

FAIRBANK'S PATENT

**Boiler Makers Wanted.**

WANTED—GOOD BOILER MAKERS, (THAT ARE NOT Society men,) to whom steady employment will be given. Apply to COFFEY & BIRDON, Boiler Works, Bush and Market streets. 13v16-4w

**CHICKERING & SONS' PIANOS**

Received the FIRST PREMIUM (Gold Medal)

And Decoration of Legion of Honor, at the Paris Exposition. KOHLER, CHASE & CO., Agents, 26v14nr16p 421 Montgomery street, San Francisco.

**STEWART'S CELEBRATED HINGED Grinder and Amalgamator.**

**The Cheapest and Quickest Pan now used.** It is flat bottomed, loses far less power in throwing the pulp, and elevates the same under the muller to better advantage than any other Pan in use, while the steam owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the muller plate; F the Grinding Shoe, attached by an adjustable hinge joint, in the middle of the same—the bottom wearing down even with the dies. Mr. J. H. STEWART, the inventor, has had ten-years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be soon at any time in operation. 14v16-1am1f

**Hunt's Double-Action Pump**

Is cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second street, and 103 Jessie street. 14v16f E. O. HUNT, Prop'r.

**HENDY'S LATEST IMPROVED CONCENTRATORS,**

**FOR GOLD AND SILVER ORES,**

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed, is the only true and mechanical one for the purpose of concentration.

**CENTRIFUGAL FORCE AND GRAVITATION,**

Combined as they are in this machine, CANNOT FAIL TO ACCOMPLISH the object sought. Many certificates from proprietors of mills, who have this Concentrator in use, can be had, if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that the proprietor is receiving repented orders from those who are using them, and who have tested their merits.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

**Directions for Operating Hendy's Concentrators:**

- First—Set the Pan, A, level, by its inner rim.
- SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
- THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

**References:**

- Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use
- EMPIRE MILL..... Grass Valley, Nevada County.
  - INDEPENDENCE MILL..... Brownsville, El Dorado County.
  - HUMBOLDT CANAL CO..... Humboldt County, Nevada.
  - EL TASTE CO..... Sonora, Mexico.
  - WOOLSEY & CO'S MILL..... Prescott, Arizona.
  - NOYES & CO'S MILL..... Prescott, Arizona.
  - GUADALUPE & SACRAMENTO G. & S. M. CO..... Sinaloa, Mexico.
- RECENTLY ORDERED FROM THE UNION IRON WORKS:
- VEATCH, VALENTINE & CO., Commercial Mill (4 Concentrators)..... Nevada County.
  - GOULD & CURRY G. & S. M. CO. (4 Concentrators)..... Virginia City, Nevada.
  - VULTURE CO. (4 Concentrators)..... Prescott, Arizona.
  - MIDAS MILL CO. (4 Concentrators)..... Virginia, Montana.
  - PLYMOUTH ROCK MILL CO. (2 Concentrators)..... Calaveras County.
  - B. F. BROWN (1 Concentrator)..... Melbourne, Australia.
  - MOREY & SPERRY (1 Concentrator)..... New York.
- And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine: The Empire Mill Company, at Grass Valley, having tested the merits of Hendy's Concentrator, to their satisfaction, have ordered six more from the Union Foundry. In addition to this, three have been shipped during the past week from the Pacific Foundry for the Lucy Mining Company, Owyhee District, Idaho.—Mining and Scientific Press, September 14th.

[From the Mining and Scientific Press, September 21st.]

[COPY.]

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co., VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly, LOUIS JANIN, Jr.

We are told by Mr. Hendy that the bill was presented in accordance with the above request, and duly paid.—[Eds. Press.]

**CAUTION.**

All of HENDY'S PATENT CONCENTRATORS are marked thus: "J. HENDY, Patented February 27th and April 17th, 1866." Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee, Union or Fulton Foundry, San Francisco.

**Foundry for Sale.**

A One-half Interest in the UNION IRON WORKS, SACRAMENTO, Owned by William N. Williams, is offered for sale on the most favorable terms. A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address WILLIAM N. WILLIAMS, 25v13tr19-16p Sacramento, Cal.

**Mineral Land Law Blanks FOR SALE.**

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866: I. Applicants' Declaratory Statement. II. Diagram, Description of Diagram and Boundaries, and Notice. III. Register's Order for Publication—with Notice. IV. Deposition that Notice has been Posted. V. Application for Survey Etc. PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid. Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge. If in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

## Cox's New Cement Mill.

We have already made several allusions to the "Cement Pan" lately invented by Capt. J. B. Cox, of this city, for the purpose of separating the gold from auriferous cement. This operation is performed in a kind of pan, with a perforated bottom, into which the cement is thrown and washed by a number of stirrers or plows, bolted to arms attached to a vertical central shaft, which revolves at the rate of about fifty revolutions a minute, and which so effectually stirs and breaks up the cement that, by the aid of a small stream of water constantly entering, the cement is thoroughly separated from the boulders and broken up sufficiently to pass through the very fine longitudinal openings left in the cast iron bottom of the pan. Although the construction is similar to that of a pan, operating with stirrers instead of mullers, it may be properly termed a mill, from the fact that the entire process of reducing or "crushing" the cement, and collecting the gold from the same, is performed by the pan and its attendant sluices without any additional machinery or manipulation—stamps or other crushing being entirely done away with. This pan is built up with sides of boiler iron about two feet high, with a diameter six feet across. The bottom is made of hard cast iron, with fine longitudinal openings, through which the cement, as fast as it is reduced to a sufficient fineness, falls into a sluice for washing and collecting the gold. The stirrers are made of steel, and firmly bolted to strong wood and iron arms. There are four arms, with four stirrers to each arm.

The charge of the pan, as now constructed, is one ton, and with a properly arranged chute for filling, six to eight charges can be worked each hour, and with cement of ordinary hardness. This work has been demonstrated by actual practice for months in succession. The cement may be introduced into the pan much coarser than it will answer to be placed under stamps. The cement heretofore worked at the Cox claim near Placerville will average about sixty per cent. of refuse or boulders and pebbles, which, after being freed from the cement, are discharged through a double trap-door in the bottom of the pan, which is conveniently opened and closed by levers.

Another of these pans has been in operation since the first of September, by D. T. Hughes, formerly an assayer in this city, at his claim near Jamestown, Tuolumne county. The result of the working of this pan fully sustains what we have said above. Mr. Cox has two other orders for pans—one from Oregon and the other from Tuolumne Co. A large number of others are thinking of putting them up. They are made for the inventor at the San Francisco Foundry, on Fremont street, in this city, where one may now be seen in course of construction. The cost of reducing cement by these pans is much less than by stamps. A single pan, with the frame, sluices, etc., complete, can be put up for from \$1,500 to \$1,800, and

will do the work of a 20-stamp mill, which will cost from \$12,000 to \$18,000, or more. We shall be able soon to give a more full and an illustrated description of this new and important invention.

## Petroleum as Steam Fuel.

Several gentlemen largely interested in steam navigation and the use of steam otherwise on this coast, went down to Santa Cruz on Monday last, to witness another trial of White's apparatus for burning petroleum for steam fuel. This apparatus has been placed in the furnace of a 15-horse power engine, where it has been subjected to a number of trials, all of which are reported successful in every particular. The fires are under the most perfect control of the engineer, and can be regulated as easily as the gas in any large number of connected burners. The principle which has been adopted by Mr. White, is similar to that adopted in the Eastern experiments; but was conceived by him, and has been the subject of almost constant thought and experiment for the past two years or more.

The apparatus by which the burning is effected is quite different from that adopted by Col. Foote in his Palos experiments, and in the opinion of good judges, who have examined the illustrations of the latter, far superior in effectiveness, convenience and durability. We understand that the party who went down on Monday were very much pleased with the manner in which it worked, and could see no reason why it should not operate for any reasonable length of time, as well as in the short time to which it was then subjected. We understand that the invention will soon be subjected to a crucial trial in this city, in which it will be thoroughly tested, and in a manner to fully determine its value.

From present indications there seems but little doubt that the problem of utilizing petroleum for steam fuel, is in a fair way to be proven a complete success. The possibility of the burning may be considered as already settled; the matter of economy as between it and coal, so far as can be judged by rough trials, seems to be equally well decided, and largely in favor of petroleum—especially on this coast where disparity between it and coal is more favorable for petroleum than in almost any other part of the world.

Great interest is being shown in these experiments by the owners and agents of the various river and ocean steamers out of this port, and it is the determination of all parties interested that nothing shall interfere with giving Mr. White's invention the fullest and most complete trial at an early day. Col. Foote left New York on the last steamer for this city, and will soon be here to look, in person, after the interests of his invention on the Pacific coast. He is accompanied by several engineers who have been connected with him in his recent trials.

CONTRIBUTORS TO OUR CABINET will hear with us another week. We shall give several very interesting items under this head next week.

## Samuels' Process for Preserving Wood.

On Tuesday of this week we witnessed at the Lincoln Works, No. 51 Beale street, near Mission, a new process for preserving wood, rendering it impervious to wet and dry rot, and impenetrable to insects. The process was invented by Mr. J. L. Samuels, who has applied for a patent. The wood to be operated upon is first placed in an airtight cylinder, and thoroughly steamed, in order to vaporize the sap in the wood; the air is then withdrawn from the cylinder, by means of an air pump, until a perfect vacuum, or nearly so, is created, which opens and frees the pores in the wood; when a solution of sulphate of iron is forced into the cylinder, under a pressure of 175 pounds to the inch, which forces the solution through the pores. This pressure is kept up for half an hour, giving the solution time to percolate or permeate every portion of the wood; when a solution of carbonate of lime is forced into the cylinder, which has the effect to precipitate the iron, forming a sulphate of lime; thus coating or filling all the minute cells of the wood with a mixture of oxide of iron and sulphate of lime. The wood is then thoroughly cleansed and dried, when it is found to have attained an extraordinary degree of toughness, and capable of receiving a beautiful polish, besides being rendered completely impervious to rot of any kind, and impenetrable to insects.

The invention is one long needed, and one which many have often vainly endeavored to effect, and will be of immense value to this city for preserving piles, which are rendered useless in a few years from the ravages of the *teredo navalis*, when the wood is used as at present. The inventor claims that wood, thus treated, will not only be useful when placed in the water, but will be equally available for railroad ties and street pavements, while from the hardening and drying process the wood is prevented from swelling or shrinking, thus providing a suitable wood for shoe pegs, and various other purposes where strength and durability is desired. The wood thus prepared is capable of resisting a crushing pressure, when compared with the unprepared wood, of eight to one, and the pressure required to break it transversely is as thirteen to one. Mr. Robert Chamberlain has made arrangements with the inventor to take out patents in Europe, and we understand that he will proceed to Europe in a few days for the purpose of introducing the process. Mr. Samuels wishes it understood that he is ready and willing to put his prepared wood to any test in order to prove that his process is what he represents it. A piece of the prepared wood may be seen at this office.

MINING REVIEW.—We publish on another page of to-day's issue, an elaborate and highly interesting review of the mining interests on the Pacific coast for the past three months, which we take from the *Commercial Herald and Market Review*. Our readers will find it of especial interest at this time.

CALIFORNIA ACADEMY OF NATURAL SCIENCES.—Regular meeting, Monday evening, Oct. 7, 1867.—In the absence of either of the regular presiding officers, Dr. Cooper was called to the chair, and presided at the meeting.

Dr. Cooper presented from Mr. Victor a specimen of salt, manufactured from springs near St. Helens, Oregon. It is fine, very white and glistening, and the people of Oregon think it is the very best salt procurable for dairy use. Though there is much competition in the market, from salt obtained on the southern coast from sea water, and from importations, yet this salt is manufactured profitably.

Dr. Stout read a paper on a resolution ordering a committee to take into consideration the subject of a suitable Academy building, and to provide ways and means therefor. He urged that the Society needed galleries more open to the public for the exhibition of its rapidly accumulating materials in natural history. There should be an enlarged library and reading-room for social and literary purposes; also a proper hall for public lectures, and a laboratory for experiments. The suggestions were acted on, and the committee appointed. Adjourned.

ENCOURAGING.—It always affords us much pleasure to find that our efforts to please the readers of the Press, or to give satisfaction to such as may favor us with orders in our capacity as patent solicitors, are properly appreciated; but it is seldom that we intrude the evidence of such approval before the public. We depart from our usual course, however, to-day, in placing the following note before our readers:

Messrs Dewey & Co., Publishers and Patent Agents.—Gentlemen.—I am in receipt of your note, informing me that my patent for an Improved Loaf Bread Machine is ordered to be issued. This is the more gratifying as the machine works finely, and my business has more than doubled by the use of it. I beg leave to thank you for the promptness and intelligence which you have shown in managing the case. Scarcely three months have elapsed since the model and accompanying documents were forwarded from this city. I would further say that you have secured any further business which I may hereafter have at the Patent Office, as well as that of my friends, so far as I can influence them. Yours truly,  
J. D'ARCY.

San Francisco, Oct. 3d, 1867.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

## Something About the Freiberg Mines.

By W. P. BLAKE, Commissioner from the State of California.

There is a tradition, generally believed, that the veins of Freiberg were discovered by a teamster named Goslar, in the twelfth century. This recalls at once the recollection of the discovery of our silver veins at Austin by the rider of the Pony Express, and it is singular that the ores of Austin and those of Freiberg are in some respects similar. In 1825, the now venerable Prof. Breithaupt made a calculation which showed that in 640 years the Freiberg mines had produced 82,000 quintals of silver, worth 240,000,000 of thalers.

Freiberg is only one of the mining centers of Saxony. The oro hearing or metalliferous region is divided into four mining districts as follows: Altenberg, 31 mines; Freiberg, 98; Marienberg, 48; Schwarzenberg, 146.

I have also indicated the number of mines opened in each, which shows a total of 323 mines in the four districts. Of these mines only 20 are worked by the government; the others are explored by companies and private capital. The total number of miners in the district, is set down in the government reports as 10,122, and the number of smelters or laborers at the reduction works as 1,175.

In the year 1865, the amount of first-class ore delivered at the Freiberg smelting works was about 33,614 tons, worth \$1,017,305 (in its raw state), or \$30 a ton. These ores when worked, gave products to the value of about \$2,000,000. The principal products, and in the order of their value, are silver, lead and its oxides, sulphate of copper, sulphuric acid, gold, zinc, nickel, bismuth, and arsenic. I have given the figures in round numbers, on account of the difficulty in calculating the different German weights and values.

The products of the Freiberg smelting works are derived not only from the ores of Freiberg, but from those of other districts, and also from distant places. Some ores are received there from South America and Mexico; those from the latter places being chiefly antimonial ores, and sent as ballast at a small cost for freight. The whole quantity of foreign ores is, however, inconsiderable, compared with those of the region.

There are three or more groups or systems of veins, having different directions and intersections at various angles. A copy of the official map of the region has been presented to me, and a glance at it would delight our "many-legged" lawyers in Washoe. Veins running parallel with each other and in close proximity, are there laid down and are regarded as separate, though usually worked under one company or administration. They are quite different from our Comstock lode, being in general quite narrow, compared with it, and without such remarkably well formed selvages or clay walls. I told one of the professors of the costly litigation we had had in Nevada upon the question of one or more ledges, and he remarked that formerly there had been similar and protracted disputes in Freiberg, until finding it impossible to settle the question satisfactorily, the laws had been changed so as to make the claims square; in other words, they adopted the plan of square locations.

The mining laws require the finder of a vein to obtain a permit to work it from the government, and to have it recorded in the government office. Each claim is divided into 124 shares, of which one belongs to the discoverer, one to the owner of the land, and two to the town. These four shares are unassessable, so that the whole expense of development or improvement falls upon the outside holders. Owners of stock have the option of giving up their shares to avoid the payment of an assessment. In this case, the shares fall into the hands of the mining office, and are sold to the highest bidder, preference usually being given to the old stockholders. The "freeze out game" seems

to have been practiced here for a long time, for I am told that the large and wealthy companies gradually absorb the smaller ones. Of all these mines, there are only six that pay dividends regularly, while there are several that just make expenses and continue to develop without assessing. There is one mine that regularly assesses the stockholders \$25 per share quarterly. The Himmelfahrt mine and the Himmelfurst are two of the most extensive in the vicinity of Freiberg. The former paid 700 thalers per share last year, and the shares now command from \$8,000 to \$10,000 each; forty years ago they could have been bought for eleven cents a share. The Himmelfahrt paid six thalers a share last year. The mines are now producing better than they have for years previously. It is said on good authority that the establishments here, including the reduction works, give in the aggregate a profit of eight to ten per cent. per annum upon the investment.

The Himmelfahrt is one of the most extensive and deepest of the mines. Its shafts are just outside of the old walls of the city, and they have been carried to a depth of nearly 2,000 feet. The length of the galleries is reckoned in miles, and portions of them extend under the town. They form a complete labyrinth, and many are so little frequented that a stranger might easily get lost and perish, perhaps, of starvation before finding an exit.

It was very interesting to me to walk through the ancient workings, where the galleries had been cut by pick and gad alone without the aid of gunpowder. They are very narrow, but are high, with the top roundly arched, and all very smoothly cut. They reminded me at once of the galleries in the Japanese mines, cut in a similar manner. One of these galleries led to a place where two tablets carved out of the solid walls, bear the date of 1767, and inscriptions noting the fact that powder was first used in the mine near that spot.

To descend to a depth of 2,000 feet, and ascend, is no small journey, and exhausts a great part of a miner's strength. To avoid this the deep shafts are fitted with the well known man-machine or *fahrkunst*, by which the trip can be accomplished with comparatively little fatigue. In this mine the man-machine and the pumps are operated by water wheels about thirty feet in diameter, which are placed in large chambers excavated far below the surface. The water is brought in by a gallery, and after passing over the wheels escapes by the adit. The hoisting is performed by the same power transmitted by wire cable to the surface. Steam is used at other shafts. The engines are generally horizontal, provided with link motion, and are connected with the hobbin shaft by gearing. The friction band operates upon the periphery of the fly-wheel, which I regard as better than our system. Their hobbins and pulleys at the head of the shaft are generally of good size—not less than eight or ten feet in diameter, and are double, so that while one cage or skip is descending the other is ascending. Round iron cable is used exclusively. No person is allowed to ascend or descend in the skip or car.

Most of the veins are without gouge or selvage, and all the ore must be blasted out. I was surprised at the small size and lightness of the German drills. A California miner would hardly consent to use them after handling our octagonal steel drills.

The country rock of the Freiberg veins is a hard tough gneiss—in fact, the typical *gneiss*—which is evidently a metamorphosed sedimentary formation, and is in many places nearly horizontal. The veins cut across it, and are, for the most part, nearly vertical. They make very little show at the surface, for there is no heavy gangue or veinstone of quartz, as with most of our mineral veins. The outcrops are generally very rusty and red, and thus indicate at once the pyritiferous character of the ores below. The ore is generally a mixture of iron and copper pyrites, with arsenical pyrites, galena, blende, and here and there the silver sulphurets. Occasionally very beautiful crystallizations of the silver minerals are found, and the cabinet of the Academy is enriched by them. It contains a magnificent collection of these ores and crystals taken from the different veins for 100 years past. Now and then considerable quantities of native silver are found. In four years, from 1857 to 1861, 8,300 pounds of this metal were taken out of the Himmelfurst mine, most of it in large plates, one of which weighed 400 pounds.

A mine called the Chur Prinz, a few miles from Freiberg, belongs to the government, and is kept as a sort of experimental mine, where new inventions and processes are tried at the public expense. I here saw some interesting concentrating machines, which I have not now time and space to de-

scribe. Two of Blake's ore breakers are in use here to prepare the ore for the jigs and other concentrators. The ore passes from one machine to the other, the last being adjusted to crush fine.

The stamping mills are very rude and do not compare favorably with ours for efficiency and economy of power. The total number of stamps about Freiberg are 656, of these 507 are dry stamps, and 149 wet.

Water is raised from the deep mines, not by water power alone, as I have described, but by Cornish steam engines at some places, and by the column of water, or "water-pressure engines" in others. Some of these latter are very perfect and interesting in their operation. Two long tunnels have been projected for the drainage of these mines. One of them is in progress. It will be about eight miles long, and will require many years yet for its completion. It is worked upon at several different points by means of shafts. The other tunnel has been surveyed and talked about, and is intended to be no less than twenty-eight miles long (28), but the money to construct it has not been obtained, and it is not probable that it will ever be commenced. The developments made by the other tunnel, in the ground outside the belt of veins have not been of a nature to encourage a hope that the lower tunnel would cut or discover new veins. During 1865, the whole number of men employed in the tunnel was 220, and the costs for the year was 78,599 thalers.

A few facts upon the rate of wages in Saxon mines may be interesting to our miners.

For eight hours work a miner receives about 20 cents (gold), an under superintendent 30 to 37 cents, and a superintendent about \$400 a year. Boys receive from 10 to 15 cents, and carpenters about the same. One-tenth part of the wages is retained for a common fund devoted to the support of indigent miners.

There is a feature in a German miner's life which will seem very odd to most Californians. Every day before the men enter the mine, they meet in a chapel at the mouth of the shaft and have a short religious service. Passages of Scripture and prayers are read, psalms are sung, in which they all join. After this the roll is called by the sub-superintendent, and the orders for the shift are given. The miners appear to enjoy good health, and to be contented and happy. They lead a quiet and simple life, and are full of good will towards others. This is expressed continually in the "*Gluck auf*," or "*luck to you*," with which you are greeted on coming or going.

I cannot close here without thanking the American students, and especially the Californians, for their kind attention to me during my visit, nor without echoing from the Pacific their kindly "*Gluck auf*."

OUR LEAD SUPPLY.—The yield of the Galena, Ill., lead mines, which form the principal source of lead in this country, has largely diminished of late years. In 1842, they produced 31,350,630 pounds of pig lead, at an average price of 2.25 cents per pound; in 1845 the yield was increased to 54,394,860 pounds, at an average of 2.96 cents. The production from that time gradually decreased, so that in 1855 it amounted to only 30,125,500 pounds, at an average of six cents. Since 1848 the United States have been dependent for their chief supply of this article on foreign countries, so much so that strenuous efforts have been made to have pig lead placed upon the free list. In 1857 the duty was reduced from 20 to 15 per cent. Under the present tariff it is two cents per pound. The Pacific coast, especially that part of it bordering on the Colorado river, and southwestern Nevada and southeastern California, abounds in valuable lead mines, from which the entire supply of the world may be derived, as soon as proper communication is opened between those distant regions and this city. The opening of the Colorado river and the construction of the overland railroad as far as the Humboldt Valley, both of which enterprises will be realized within the next twelve months, will place the yield of these mines within the ready reach of a market, and active preparations are already being made to work many of them on an extensive scale. Two or three in fact, are already yielding large amounts of lead, the most of which is being stored for future transportation; the working expenses of the mines being paid by the silver which accompanies the lead.

## Commercial and Financial Summary.

Under this heading the *Commercial Herald and Market Review* makes the following interesting and truthful remarks upon the material progress and growing resources of the Pacific Coast:

The first three quarters of the year just brought to a close have been marked by a large average degree of prosperity among the people, not only of California, but throughout the entire Pacific coast. Glancing over this period we find that nearly every branch of industry and field of investment has met with a fair and, in many instances, with a munificent reward. Rarely ever before in the history of the country has such great and generally gratifying progress been made in every department of business as during this time. Labor has been in full demand and well rewarded; manufacturing has been active with remunerative prices and money abundant at moderate rates for all legitimate purposes.

The shipping interest has been especially flourishing, the tonnage of the port having been employed the most of the time to its fullest capacity. Trade and commerce, without being attended with the liberal gains of earlier years, have been healthful and occasionally active, there having been but few failures or other financial disasters to record. Mining enterprise has not only escaped the ruinous losses that so often befall it a few years since, but has, for the most part, been attended with satisfactory results, indicating for this important branch of business more steady and profitable returns than have ever yet attended it. Payments by interior dealers have generally been made with promptness, pointing to a prosperous trade and an easy state of finances throughout the country. Ship and boat building has revived, not only at this port but at other points along the coast; it being particularly brisk just now about Puget Sound, to which locality, because of its advantages, much of this business will probably be hereafter transferred. Indeed, it seems likely that this magnificent water will soon become one of the greatest centers of naval construction in the world, the facilities for ship building being greater here than at any other known point.

As customary, trade at this point has been more active during the third quarter of the series under review than throughout the others, the business of the past three months comparing favorably with that done in any former corresponding period. Orders for machinery, both for quartz mills, marine, railroad and other purposes, have been large, keeping the most of our foundries and shops fully engaged. A new item in this line consists of architectural castings, a vast amount of which is now being employed in the construction of the better class of buildings. Agricultural implements are also now being largely manufactured in this State, those of home make being, like our quartz mills, generally preferred to the imported article. It is gratifying to observe that there has been less disposition manifested among our inhabitants thus far the present year to emigrate to points beyond the limits of the State, as well as on the part of our moneyed and business men to invest in foreign and other distant localities, where returns, as experience has amply shown, are by no means so large or certain as nearer home.

Greater attention is now being turned to farming and similar pursuits than to the more precarious business of mining, and as a consequence good agricultural lands as well as other kinds of productive real estate are appreciating in value. The money accumulations of the country—greater now than ever before, as the deposits made in the savings banks show—are being utilized more than formerly in the purchase of lands for cultivation, or of city property for improvement, much also being used in efforts to establish manufacturing in a small way, or, in some instances, through associated capital on a larger scale; all bespeaking a settled confidence in the future of the city and State, and indicating a growing thrift on the part of the laboring classes.

A review of our Agricultural market for the first nine months of the present year exhibits a progress as wondrous as it is gratifying. Our exports of Flour and Wheat are enormous in comparison with all former years, as will be seen by the following figures: To New York we have sent 209,791 barrels of Flour more than during the same period last year, and also 357,104 more sacks of Wheat. Great Britain has taken 2,251,080 sacks of Wheat more than in the first nine months of 1866, equal to \$4,500,000 at two cents the pound. No account is made of Flour, of which she has taken 38,761 barrels so far this year. Our breadstuffs trade with China and Japan has decreased considerably, but there is every reason to predict a revival during the next quarter. Most of the breadstuffs shipped to those countries last year were exported during the last quarter of the year. South America is rapidly opening her markets to our Wheat and Flour, the exports being 62,393 barrels Flour and 11,049 sacks of Wheat this year, against nothing during a corresponding period last year. Our trade with British Columbia, in the same articles, has almost reached zero. This is accounted for principally by the great decrease in population in that quarter of the globe. Australia and Mexico also exhibit a decline in the same trade, while with all other countries we are rapidly gaining ground. The total amounts of Flour shipped up to the 1st of October, 1866, was 241,413 barrels, while the quantity shipped the present year is 424,274 barrels, an increase of 192,861 barrels. The whole number of sacks of Wheat shipped during the same period last year was 1,333,657, and this year it has reached 3,506,574, or 2,162,917 more. The Flour this year expressed in Wheat would equal 1,302,832 sacks, being an increase of 578,483 sacks over last year. The combined value of the Flour and Wheat shipped this year in excess of 1866 reaches \$3,212,740. These facts speak for themselves and require no comment.

Quite recently, efforts last year inaugurated, have been resumed for aiding in opening up the Colorado River to navigation. Many of our leading merchants having subscribed liberally towards that purpose, it is now thought that freights will soon go forward through that channel with less delay and at lower charges than heretofore. Railroad transportation is also beginning to tell with beneficial effect upon the carriage of goods over local routes and to certain points in the more distant interior. The road of the Central Pacific Company, penetrating one of the great mining regions of the State, and extending thence across the Sierra Nevada, is especially felt in the transmission of freights to points along and near its line; and cannot fail, by establishing winter communication with Nevada, to greatly relieve the trade and business of that State, and of such points beyond as receive supplies through that channel.

In concluding our remarks on the material progress and growing resources of the coast, it may be observed that we are fast becoming self-sustaining in many of the staples of manufacture and the prime necessities of life, enabling us to retain for home investment large sums heretofore sent abroad for the purchase of these commodities. Among the articles most entitled to notice in this connection are salted meats, more particularly pork, bacon and hams, supplies of which, as well also as of lard, have hitherto been obtained chiefly from the Eastern States. The large number of swine now in the country and the facility with which these animals can be raised and fattened, renders it probable that this will be the last year that we shall be even in part dependent on sources outside our own limits for any thing in this line of provision.

## Mechanical.

**HEAT FROM PERCUSSION—HAMMERING IRON TILL IT BECOMES RED HOT.**—A late correspondent of the *Chemical News* intimated that the statement in many elementary works on science, to the end that blacksmiths are sometimes in the habit of hammering a cold nail or an anvil until it becomes red-hot, is a mistake. He suggests that the cooling influence of the anvil would be sufficient to keep the heat from rising to redness; and that the nail would become flattened out to foil before it would attain such a heat. Another correspondent in a succeeding number replies as follows: "I beg to state that it is a common thing for a good blacksmith to hammer a horseshoe nail red hot upon a common anvil. I have seen it done by one Jesse Stubs repeatedly, who informed me that 'years ago when he was a lad,' it was not an uncommon thing for a journeyman blacksmith on applying for work, to have to prove himself a good hammerman by making a nail red-hot in as few a number of strokes as possible. I once produced a blacksmith and anvil at a lecture, before the Royal Literary Institution of Hull, when the man made the nail glow before the audience by hammering it. Old blacksmiths in the country say that before the days of Congreve, Letchford, or Bryant and May, they many a time lighted their forge fire of a cold morning by means of a nail made red-hot by converting motion into heat, or as they term it, 'a few sharpish taps' with a hammer. Let 'Skeptic' go to a large blacksmith shop and offer a shilling to every man who will hammer a nail red-hot, and unless blacksmiths have degenerated during the late severe winter, he will soon part with his money."

**MORE OF THE APPLICATION OF MAGNETISM TO THE MANUFACTURE OF WROUGHT IRON.**—It would appear from the following paragraph, which we clip from the *London Mining Journal*, that the idea of applying magnetism to the manufacture of wrought iron is not a new idea. "Some twenty years ago," says the *Journal*, "Mr. Arthur Wall's electric process was applied to the manufacture of iron at the works of Mr. Jessop, at Codnor Park, Derbyshire; but owing to the expense of obtaining voltaic electricity it was found not to be of any practical utility; and Dr. Ure, in his dictionary, (edition for 1846,) mentions that he had then 'proved by experience that had the direct magnetic power been applied instead of the electric, a successful and practical result would have been attained.' The recent advances made in the cheap production of electricity have been availed of by Mr. Wm. Robinson, of Watling street, who states that the general theory upon which he proceeds is that heat, light, electricity, magnetism, motion and force are mutually convertible into each other. It is now rendered indisputable by Mr. Wilde's demonstrations with this powerful machine that mutual relations do really exist between them; thus his large electro-magnet is excited by the electricity evolved from a number of smaller magnets, whose action is rapidly repeated by a swift motion derived from heat, the combination is then capable of producing intense heat, intense light, or intense force, at the will of the operator, independently of combustion at the point of manifestation."

**CUT NAILS.**—Common cut nails are too brittle for repairing implements, or for other similar purposes. Buy only the very best for that purpose and anneal them, and they will answer all ordinary purposes of the best wrought nails. To anneal them, all that is necessary is to heat them red hot in a common fire and cool gradually. Let them cool, for instance, by remaining in the fire while it burns and goes out. One such nail, well clinched, will be worth half a dozen unannealed.

Every farmer should keep on hand a supply of copper wire, and small pieces of sheet copper, or copper straps. Copper wire is better than annealed iron wire; it is almost as flexible as twine, and may be bent and twisted as desired; and it will not rust. Copper straps nailed across or around a fracture or split in any wooden article, will strengthen it in a thorough manner.—*Rural Affairs*.

PHILADELPHIA claims to be the greatest manufacturing city in the Union. Her operatives number about 97,000, and their gross earning reach \$136,000,000 annually.

**FACTS FOR MECHANICS.**—St. Paul was a mechanic, a tent maker. Our Savior was a carpenter. The great Architect of the Universe has set his creatures an example in constructiveness, in the mechanism of the heavens and the earth with their productions, animate and inanimate, but which they never equal nor approach.

Next to farmers, mechanics are the most numerous and important class of the community. Whatever promotes their interests promotes the interests of the public. They, like farmers, have great facilities and inducements to become men of science and sound knowledge. Every mechanic in every operation brings into use some principle of science, which principle it is his interest and convenience to understand.

Every apprentice, no matter how assiduous or rigorous his employment, if he spends an hour daily in useful reading and modes of improvement, is certain to be a man of future influence and respectability. The apprentice who seeks most assiduously the interest of his employer, promotes effectually his own interest; as character is the best thing a young man can have for the commencement of business. Mechanics, like farmers, make safe and enlightened statesmen. They are well educated for legislators and for other officers, because educated in schools of experience. Who can be better qualified to make laws for aiding the operations of business than those engaged in these operations.

**THE ART OF GRINDING TOOLS.**—More than one-half of all the wear and tear and breakage and bother of dull tools comes from a lack of proper knowledge and practice in grinding. All steel, however refined, is composed of individual fibers laid lengthways in the bar, held firmly together by cohesion; and in almost all farm implements of the cutting kind the steel portion which forms the edge, if from a section of a bar, is laid in and welded to the iron longitudinally, so that it is the side of the huddle of fibers hammered and ground down that forms the edge. Hence, by holding on the grindstone all edge-tools, as axes, drawing-knives, knives of reapers, scythes, knives of straw-cutters, etc., in such a manner that the action of the stone is at right angles with the plane of the edge, or, in plainer words, by holding the edge of the tools square across the stone, the direction of the fibers will be changed, so as to present the ends instead of the side as a cutting edge. By grinding in this manner a finer, smoother edge is set, the tool is ground in less time, holds an edge a great deal longer, and is far less liable to "nick out" and break.

**POWER OF INVENTION.**—The last two great wars have illustrated in a new light the fact that one thought is mightier than a million arms. The inventor and the engineer fight the battles as well as do the work of the world. If there are exceptions and limitations to this statement at present, they are rapidly giving way before the advance of science, and the time is coming when they will be no more. We have only to suppose the inventor of the needle-gun to have been an Austrian or a "confederate" to perceive how the condition and future of either hemisphere might have been reversed through the agency of one man. Had the monitor sprung full-armed from a Southern instead of a Northern brain, where now would have been the United States? But there were reasons for these things as they were. The future policy of nations is too plain to be missed by a plain man, however theorists may obscure it. Only those who most successfully cherish, most determinedly grasp the whole system of arts and manufactures will hereafter be strong and secure.

**PROPER SPEED OF WOOD-WORKING MACHINERY.**—Velocity of circular saws at periphery, 6,000 to 7,000 feet per minute; velocity of the band-saw, 2,500 feet per minute; velocity of gang saws, of 20-inch stroke, 120 strokes per minute; velocity of scroll saws, 300 strokes per minute; velocity of planing machine cutters at periphery, 4,000 to 6,000 feet a minute.

Travel of the work under planing machine, 1-20th of an inch for each cut; travel of the molding machine cutters, 3,500 to 4,000 feet per minute; travel of the "squaring-up" machine cutters, 7,000 to 8,000 feet per minute.

Speed of wood-carving drills, 5,000 revolutions per minute; speed of machine augers of 1 1/4 inches diameter, 900 revolutions per minute; speed of machine augers of 3/4 inch diameter, 1,200 revolutions per minute.

Gang saws require for 45 superficial feet of pine per hour one-horse power indicated. Circular saws require for 75 superficial feet of pine per hour one-horse power indicated. In oak or hard wood 1/2 of the above quantity require one-horse power indicated.—*Molesworth*.

## Scientific Miscellany.

**STEREOSCOPIC.**—*Editors Press:*—A book in the Odd Fellows' Library, of this city, containing several stereoscopic views of the island of Teneriffe, some time ago led me to a singular discovery,—at least I claim it as such, not having read or heard of anything similar before. It is the fact that you can behold and contemplate stereoscopic views without the aid of a stereoscope, though with the same effect, but more minutely, even.

To effect this end, you have to take a glance at some object about 100 or 200 yards, distant, keep your eyes fixed in this direction; then introduce the picture into this fixed line of sight at the visual point (the point nearest to the eyes, where you can see any object with the most perfect clearness.) Probably you will then behold four pictures instead of two, but the two middle ones will appear very much mingled; then you have to try either to move the picture slowly to and fro, or cast your glance farther off or nearer by. Thus, you will find, that the outlines of the two middle pictures will change, and finally you have to try to bring these outlines into one. As soon as this is effected, of course you will see only three pictures; your eyes must rest upon the middle one, when this will show every object elevated exactly, as seen by the aid of a stereoscope, when the other pictures on each side will not. With a little practice, you will soon be able to control your eyes in this respect, so as not to be in want of the above stated proceedings; but neither will I say that everybody can learn this kind of eye-glancing, as only very few of my friends to whom I explained the matter have learned it, when most of them could not.

E. J. PFEIFFER.

San Francisco, Oct. 2, 1867.

**AERONAUTICAL.**—There seems to be more to be done at the present time, a persistent effort being made to advance the science of aeronautics to a practical utility. Numerous scientific men are engaged in the effort. The same principle, with various modifications, as an aid to elevation, and as a means of locomotion is being extensively experimented with. The greatest interest, however, seems just now to attach to some recent experiments of Dr. Wm. Smith, of London. The Doctor asserts that the wing of a strong pigeon strikes the air with a force which will raise a pound weight one foot high in a minute. But as soon as the stroke has produced its greatest mechanical effect it is suddenly cut short, nerves in the wing of the bird letting it know when the maximum effect is attained. He has succeeded in cutting some of the nerves of the bird from the organs of motion, the result being that although the bird flapped the air harder than before, it could not fly. He thinks, therefore, that in attempting flight by means of artificial wings, the stroke must be cut short when it has attained its maximum. On these principles he proposes a machine with artificial wings, propelled by motive power obtained from the explosions of mixed oxygen and hydrogen gases. The heat thus produced is not great, the gases would be exploded in india rubber accordion-shaped vessels, and these by their expansion would give the stroke.

**OXIDATION BY MEANS OF CHARCOAL.**—A communication was lately read at the London Chemical Society, concerning experiments made with recently burned boxwood charcoal. It was first placed in pure oxygen gas, and, after being saturated with other gases and vapors, the absorption as well as the resulting vapors were noted. Moist sulphurous acid and sulphureted hydrogen were changed to sulphuric acid; common alcohol to acetic acid, amylic alcohol to valerician acid; but the author asserted that ammonia does not undergo oxidation in the pores of charcoal.

M. ZALAWSKI has discovered a method of augmenting the power of a Bunson's battery, and making it more lasting. He uses two porous vessels, one within the other. In the inner one, which contains the carbon, he puts nitric acid, and in the outer sulphuric acid. In the outer vessel containing the zinc, he places a solution of sal ammoniac. No effervescence, it is said, takes place, and no zinc is consumed uselessly.

THE ACADEMY OF SCIENCES, of Paris, it is well known, is made up of a fixed number of members, which is never increased. When any member dies his chair is filled at the next meeting by balloting. None but the most eminent among savans have any chance of obtaining a chair of membership in that body—not even royalty itself can reach that distinguished honor except by the difficult road of scientific attainments. It is said to be the earnest wish of the present Emperor Napoleon to receive that honor, and he still hopes to attain it by his literary and inventive genius. The recent decease of M. Pelouze created a vacancy in this body; there were several candidates proposed, among them M. M. Cahours, M. Berthelot and M. Wurtz. The election finally resulted in the choice of the latter named *savant*. M. Wurtz was the discoverer of glycol and compound ammonias. These two discoveries gained for him the prize of \$2,000. He is also the author of a valuable work entitled "Chemical Philosophy," which has been translated in many languages. His claims were considered of the first order. The number present at the election was fifty-three. M. Wurtz was elected by forty-five votes against three given for M. Berthelot, and two for M. Cahours, and three blank. The three blank ones were an intimation that there was that number in the Academy who did not think that either of the three names presented were worthy to sit in their illustrious assemblage. In view, especially of the high attainments of the successful candidate, it was considered a most foolish display of importance and disdain, and a public exhibition of a most ridiculous meanness of spirit on the part of the learned Academical trio.

**MERCERIZING COTTON** is the term applied to the discovery of the peculiar action of caustic soda and sulphuric acid upon cotton. This singular process is called "mercerizing," from the name of its discoverer, and has the effect of untwisting the normally twisted tubes of cotton filaments, and converting them into cylindrical tubes. When colors are applied to the cotton so treated, they pass more readily through the minute pores of the tubes, and are precipitated in denser layers in the interior of the latter, whereby darker and more permanent shades are produced. Calico so treated becomes greatly increased in strength, and though hitherto no large quantities of cloth thus prepared have been printed, owing to the expense of preparation, advantage has been taken of the process to prepare the cotton fabric used in the production of the endless web known to calico printers as the india rubber blanket, which, when made with prepared calico, is rendered more durable. There is no doubt that Mr. Mercer's discovery is a valuable one, and when the objections to it become more generally known, some one may succeed in overcoming them. The advantages are that the fabric contracts about one-fifteenth linearly in each direction, and the threads appear rounder, firmer, and closer together; the cloth does not reflect so much white light, but has a translucent appearance. Its strength is also improved; cotton thus treated shows a superior affinity for some colors, especially indigo blue; it takes as deep a shade of blue at one dip as common cloth takes in six, and, generally speaking, colors look better on this than on untreated cloth. The objection to the process was mainly the expense of the soda, but now that this agent has been reduced in price this objection will not be so formidable. It was also said that the appearance of greater fineness and closeness, produced by the contraction of the fiber, could be more surely and economically produced by the loom.

A NEW ANESTHETIC has recently been introduced—a quadrichloride of carbon, which omits an agreeable smell of quinces, and can produce insensibility in less than one minute. The insensibility so produced, may be maintained with or without loss of consciousness; its effects cease speedily when desired, and are not followed by vomiting. It has also been successfully used for obstinate headache.

An explosive matter is obtained by treating a common glue with a strong solution of chlorate and nitrate of potash. This material, it is said, burns like ordinary gunpowder.

[From the Commercial Herald and Market Review.]

MINING REVIEW.

The business of mining during the past three months, constituting the third quarter of the current year, without being signalized by any marked discoveries or unwonted excitement, has been generally prosperous and progressive. This interest, as has been justly observed, is now in a sort of transition state on this coast, passing gradually from the precarious, fluctuating and transitory, but often largely remunerative business of stream-work or alluvial washing to the more difficult and expensive but, at the same time, more permanent and certain pursuits of cement and vein mining, calling for the employment of a greater amount of capital and skilled labor, and attended generally with larger and more certain but less immediate returns. Even the former branch of the business, as at present conducted, is much more costly and complicated than during its earlier stages, when the rudest implements and the simplest manipulations sufficed to segregate from its associate materials and to secure the granulated gold, the only metal then sought for. The pan, the tom and the rocker of the pioneer gold digger, have, except in a few localities, been long since superseded by the sluicing, hydraulic and other improved modes of washing, whereby immense masses of earth are readily broken down and deprived of their auriferous contents. The placer miner instead of pursuing his calling along the gravelly bars and in the beds of the rivers and alluvial gulches, where the most shallow excavations answered every purpose, now engages more extensively in deep explorations, sinking his shafts far down and driving his tunnels into the deeply buried cement and gravel beds; or, penetrating the superincumbent ruins of former geological systems, drifts along the auriferous channels of ancient rivers, richer, by far, than those more modern streams that supplied the earlier fields of mining industry. Vast banks of earth are shattered with powder and sluiced away; huge piles of tailings are annually washed and reworked, every year bringing with it some valuable invention and material advancement or marked change in the implements used and modes employed in this department of mining. But it is in the other branch of the business—in the working of quartz or vein mining that the greatest progress is being made, and the most vital gains achieved. As in this department the difficulties to be encountered were more formidable, so here the improvements made have been most signal and important, involving in their consequences questions economical, chemical and mechanical. As to the best methods of attacking and exploring the ore channels much has been learned, resulting in a greater economy, security and system, than had before been attained. A more careful and conservative policy is being observed in the conduct of leading mines, looking to their preservation and permanent productiveness rather than immediate and excessive profits. Improvements are constantly being made in the construction of machinery and the application of steam, some of which promise to effect a great saving of labor and propulsive power. The great problem of the successful treatment of the sulphureted ores of the precious metals makes gratifying progress; several large chlorination works erected in different parts of the State now being operated with results that promise for it an early and satisfactory solution. Other works have also been put up for treating these sulphurets by a cheaper and, as is claimed, more effectual process, while many of the more obdurate silver-bearing ores are being successfully reduced by means of smelting or such other modes as varied and persistent experiment has established as best. New explosive compounds are about being substituted for gunpowder whereby it is thought a saving of at least one-half the present cost of blasting can be effected, while the completion of railroad communication with many of the great mining centers of the State and its early extension to or near others, still further in the interior, cannot fail to impart to this branch of business an activity and insure for it a prosperity greater than it has ever yet experienced. The almost entire cessation of Indian hostilities in the earlier settled portions of the mineral regions has told favorably on the progress of many of the more out-lying districts, some of which had previously been much retarded by this cause. At present all the older Pacific States and Territories are nearly exempt from the depredations of the native tribes, though the latter still continue by their attacks or menaces to prevent exploration and defeat mining operations in many parts of Montana, Utah and Arizona; certain sections of which can neither be settled nor even prospected until these savages are destroyed or effectually subjugated. Another element of thrift in the more inland mining districts is the extent to which they are becoming able to supply all food-stuffs, flour and other staples of subsistence by products of local growth. Even in the more remote and desert sections of country a sufficiency of these commodities has been raised to meet every home requirement; the capacities of Arizona, the vast regions east of the Cascade Range and those lying between the Sierra Nevada and the great Central Cordillera of the continent, proving, in this respect, much greater than had hitherto been supposed.

Since the issue of our last semi-annual review the Commissioner for the collection of mining statistics on the Pacific coast has completed his labors and transmitted the same to Washington. His report, the material for which has been collected with the utmost diligence and care, is comprehensive, voluminous, and beyond all question one of the most useful and instructive papers ever compiled upon the resources and industries of this or perhaps any other country. It seems to cover the whole field fully and nothing appears to have been forgotten, slighted or overlooked. Questions of finance, agriculture, transportation, manufactures and commerce—of private interest and public policy—are all considered with reference to their bearings on the subject of mines and mining. The work is eminently practical and utilitarian, abounding in facts and figures drawn from the most intelligent and authentic sources; it having been the aim of the Commissioner to make it so thoroughly reliable that it could safely be adopted as the basis of legislative action as well as of extended business operations. To this end all his subordinates, of whom he had some twenty in his service, were specially enjoined to arrive at the utmost possible accuracy in the collection of facts, to keep within bounds, avoiding exaggeration and mis-statement, it being his desire to represent things in a light too subdued rather than over color or magnify the truth. Being compiled, then, with such a strict regard to exactness, and by parties every way competent and veracious, this work, when it shall appear, will have strong claims to be received as an authority upon the various topics of which it treats. That it will, despite these precautions against exaggeration, exhibit for our Pacific possessions an immensity of mineral wealth need hardly be stated. Indeed, the representations made of these and our other material resources are such as cannot fail to astonish the world by reason of their ready availability and vastness. The nations of the Eastern Continent, accustomed to pursue the business of mining in fields of comparatively narrow limits, will be amazed when they come to learn through an authoritative channel the richness and

extent of the mineral regions lying west of the Rocky Mountains. Here, instead of a few small districts, as with them, they will perceive that our metalliferous ranges stretch over States and Territories, either of them larger than almost any kingdom in Europe, our lodes being at the same time heavier and the ores much richer than there. Here, they will readily come to understand, are fields of profitable industry broad enough to absorb the cheap capital and give employment to all the surplus labor of the old world. Fields of industry, too, already explored and opened up to the enterprise of all peoples, native and foreign alike—our system making no distinction in this respect between our own and alien citizens. Here the miner from abroad can take up and hold claims, work and sell the same or buy others, without divesting himself of his nationality—enjoying, if he choose, all the advantages without assuming any of the burdens of citizenship. Here the laborer can command steady work at wages more than double those he has been accustomed to receive; or, if he prefer, become his own employer, with abundant chance of success. Here the capitalist receives every encouragement and protection, his investments enjoying immunity from annoying espionage and excessive taxation, and being safe against the fluctuations to which most other governments are exposed. Here there is no danger of his being oppressed by arbitrary laws or molested by official interference, as in many other mining countries. With us he is not liable, as in Mexico and South America, to be plundered by the government on the one hand and guerrillas on the other, nor subjected to a vexatious surveillance or the payment of royalties and other exactions. All these and many other advantages peculiar to our mining policy will be made apparent, attaining to wide notoriety through the pages of this report, an immense edition of which, it is understood, will be issued with a view to its broad and liberal distribution. That great and lasting benefits will through its agency accrue, not only to the mining region but to the country, and even the world at large, cannot be doubted. When the extent to which our own people have put their labor and means in mining properties, and in improvements auxiliary to that interest is understood abroad, an increased confidence in them as sources of permanent and profitable investment cannot fail to be the result. The fact that we have, in California alone, spent more than thirty million of dollars in the erection of quartz mills and the opening of mines, and almost an equal sum in the construction of water ditches, flumes, roads, etc., designed chiefly to promote their effectual development, cannot fail to be accepted as evidence of our faith in their vast and enduring richness. We have now in this State 420 quartz and cement mills carrying about 4,500 stamps, the whole erected at an aggregate cost of more than six million of dollars. About three-fifths of these are propelled by steam and the balance by water, a small number being driven by both steam and water. Besides these mills there are something over 400 arrastres, the most of them being connected with the mills for amalgamating purposes. These quartz mills carry from five to sixty stamps each, the number in most of them ranging from ten to thirty. The cost of their construction varies from \$10,000 to \$120,000 each, the average being about \$35,000. With the exception of those in Alpine, Mono, Inyo, and San Bernardino counties, they all work for gold alone. In the two counties first named only the silver saving process is adopted, while in the other two the ores are worked both for gold and silver.

How rapidly the business of quartz milling has increased in California is shown by the fact that there were but 140 mills in the State ten years ago, the whole of which carried but 1,500 stamps, and were built at a cost of less than \$2,000,000. Besides the above there are in the other Pacific States and Territories 285 quartz mills, supplied with over 2,600 stamps, and erected at an aggregate expense of nearly \$3,000,000, the building of which is largely due to California enterprise and capital. The linear extent of the main water ditches in California reaches 5,500 miles, with nearly 1,000 miles of branches for distributing the water at points more or less remote from the line of the principal ditches. The total cost of these works, including flumes, branches and reservoirs, approximates \$16,000,000. Some of them are of large capacity, and extend a distance of nearly five hundred miles. The most expensive, that of the South Yuba Canal Company, cost \$1,500,000—the cost of many others reaching from two to six hundred thousand dollars. The principal object of these ditches is to supply the placer mines with water, though they also furnish a good deal for irrigating purposes as well as for the propulsion of machinery. If to these sums we add others of minor importance, such as those spent in the construction of hydraulics, roads, bridges, etc., we shall have another heavy item of expenditure incurred for purposes subsidiary to the business of mining in its several branches, leaving out of account the still larger amounts spent in the purchase of mining properties in their various stages of development, or on behalf of labor and current expenses attending their working, the whole aggregating some hundred millions of dollars.

It is true, that these investments have not always proved either safe or profitable. Much money has been lost through inexperience and errors of judgment not only in the business of mining itself but also in the prosecution of enterprises designed to aid and encourage it; yet these losses have hardly been greater than those attending many other pursuits carried on in a new country and under circumstances eminently precarious and trying; while it may safely be affirmed that the business of mining for the precious metals on this coast is attended at the present time with as much certainty and as fair a chance for profit as merchandising, farming, manufacturing or any other of the leading industries of the country—a conclusion warranted by the accounts that reach us from nearly all parts of the Pacific slope of the continent. We have now data to justify the belief that the hullion product for the current year will be larger than usual, while it is well known that the cases of failure caused by injudicious investments are constantly diminishing. While some mills have been idle and some mines have remained unworked in different parts of the country, caused in some instances by mistakes of the kind mentioned, and in others by a lack of means or the want of a suitable process for the treatment of the ores, the cases so common a few years ago of parties expending immense sums in the purchase of worthless mines, erecting often costly mills in addition for the purpose of working ores that did not exist, are now no longer heard of. On the contrary, while very liberal investments continue to be made, no mining property can now find sale until it has been at least partially proved, nor are mills apt to be erected until there is an assurance that the ore supply promises to be ample. With these precautions quartz milling and mining is assuming a new and more hopeful phase, nor is there any likelihood that the former reckless style of procedure will ever again obtain in the conduct of this business. With these reforms achieved and the economies gained, as before related, the pursuit of mining is largely assuming the elements most attractive to capital—security and profit—placing its success on this coast beyond contingency. With cheapened cost of production the percentage of loss in the working of ore is constantly being diminished. This is especially true of operations in California, where the mills

working auriferous quartz are able, as a general thing, to save within 25 per cent. of the gold it contains as shown by fire assay; those adopting the chlorination process in the treatment of sulphurets saving 50 per cent., while some newly invented modes claim to be able to work at less expense and much more closely.

In the State of Nevada, where they have to deal mostly with silver bearing ores, the results obtained are widely different, the mills about Virginia City, working the Comstock ores, mostly reduced without roasting, saving only about 65 per cent. of the metal, while those at Austin, Twin River, and in the Cortez District, where roasting is practiced, save from 80 to 90 per cent. The saving at Belmont is still less than about Virginia, the ores there being worked by a cheap and expeditious process, whereby 40 per cent. of the silver is left in the tailings, which are carefully preserved for future treatment. It having been found that much of the ore in certain localities, as in the Humboldt and Esmeralda sections of country, can be successfully reduced only by smelting, works for this purpose have been erected there, and are now being operated with excellent results. Taken as a whole the business of mining in that State is likely to prove more prosperous the present year than ever before—the product of hullion approximating \$20,000,000, a gain of more than 20 per cent. on the yield of any former year; while the favorable situation of things there warrants the belief that the product will be increased in a corresponding ratio for several years to come.

In Arizona operations in quartz continue to be delayed by the difficulty encountered in finding a suitable process for reducing the sulphureted ores and the persistent hostilities of the Indians, these causes having also to some extent interfered with the progress of both this and placer mining in Utah, Idaho and Montana. The Lemhi mines, discovered over a year since in Idaho Territory, and to which there was a considerable emigration in the early part of the present summer, though quite extensive, have failed to pay more than very moderate wages, while those found about the same time in the southern part of Utah have been but little prospected on account of the Indians, who have refused to allow the whites to enter the country. The placer mines discovered during the past summer on the upper waters of the Humboldt, in the north-eastern part of Nevada, have also proved to be of but limited extent and richness, though several small parties have made fair wages there at surface digging, and the region abounds with what appear to be valuable quartz veins. Very recently an extensive range of placers has been found on the upper tributaries of the Payette River, Idaho, quite a numerous population since gathered there, being now engaged washing with good results. Discoveries of surface mines, though of less magnitude, have been made elsewhere during the present season; and, viewing this branch of business as a whole, it would seem to have been attended up to this time, with at least an average degree of success.

In our recently acquired territories on the northwest there is good reason to believe extensive deposits of the precious metals will be found as well also as valuable beds of coal, iron and copper; and it is anticipated that the country will be thoroughly explored with a view to ascertaining the extent of its mineral resources the coming season. During the past three months the more subordinate branches of mining—coal, copper and quicksilver, have been conducted with an average degree of success, the product of the New Idria quicksilver mine, now worked with a large force, being constantly on the increase. The Borax Company at Clear Lake continue to extract about thirty-five tons monthly of this salt, for which they find an increasing demand, and, although but little is being done just at present with our petroleum deposits, there is no doubt, considering their immense extent and the prospect that this material will soon come to be used as a fuel, but what they will in a short time be made largely available for this and other purposes.

What Others Say of Our Paper.

The Mining and Scientific Press is all that its publishers claim for it, being a compendium of mining news on the Pacific Coast, and a general disseminator of all matters of interest to the mechanical and agricultural portions of the State.—Dutch Flat Enquirer.

The Mining and Scientific Press, San Francisco, has entered on its sixteenth volume. The Press is worth its weight in gold to the artisan and the miner, and is always filled with original matter of deep interest to all classes.—Amador Ledger, July 13th.

Congratulating you on the many very great improvements you have made upon the Press—its usefulness and prosperity.—Letter from Editor Sac. Dec.

That excellent paper has done a new dress of California manufacture.—Keese River Reveille.

The Mining and Scientific Press—a most useful exchange.—Oayhce Avalanche.

BUSINESS NOTICE.—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

JACOB SNEY, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (date 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new Cabinet Photographs, which he is taking to perfection. 10v14ft

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15ft

FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v14ft B. F. HOWLAND, Artlst.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and in many instances, unnecessary. DR. BEBBS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14ft

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patenting their Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

AN INSTRUCTIVE BOOK!

Prof. LAYRES' ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a notorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS: It is simple, concise, and well arranged. It seems to be a work of great value.—John Sloat.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Dennison.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all these who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Hervon Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—J. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. \* \* \* Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Bouie.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap, convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken,) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an ace in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marquette Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO, Mining and Scientific Press, San Francisco. 6v15ft

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 12, 1887.

Bullion Product.

The following table shows the bullion product of the leading claims on the Comstock Lode during the first nine months of 1887:

Table with columns for Company Name, Location, and Bullion Product (in various units like ounces, pounds, etc.). Includes companies like Hale & Norcross, Savage, Crown Point, etc.

In the above table we have estimated the bullion receipts of the Yellow Jacket company for July, August and September. The bullion of the Kentuck company is placed at \$101,000 for September, though the receipts may be somewhat increased.

During the past three months city shares have been quite inactive, the sales being comparatively meagre under the very excited state of the mining share market.

IMPERIAL—advanced from \$130 in January to \$282 in April, declined to \$136 in May, sold at \$237 in July, fell to \$114 in September, and sold during the past week at \$114.

KENTUCK—came into the market in May, selling at \$180, rising at the close of June to \$260, dropping to \$154 in September, and selling yesterday at \$245.

GOLD HILL QUARTZ—ADVANCED M. & CO.—was placed on the market in the spring at \$200, and advanced to \$240 at the close of July, fell to \$180 in August, and sold at \$175 in September.

SOAP FACTORY.—The new establishment of Messrs. Lucy & Hymes, at the corner of Eighth and Brannan streets, is said to be the largest of the kind on this coast.

ELECTION OF OFFICERS.—NORTH STAR G. M. Co.—October 9th. Trustees, A. C. Peachy, Delos Lake, A. J. Pope, W. H. V. Cronise, G. W. Beaver.

constitute the burden of dealings on the Stock Exchange; but not all parties have the same view of such a thing.

That these mines should be operated more with a view to considerations of the future, that they should be preserved from the unhealthy influences to which they are now so largely subjected, that greater economy should be observed...

constitute the burden of dealings on the Stock Exchange; but not all parties have the same view of such a thing. Those at all conversant with the history of these transactions need not be reminded how often a similar condition of things has obtained during the past few years.

The following is a condensed review of claims upon the Comstock Lode for the past nine months: SAVAGE—has been in marked favor during the past nine months, having at the beginning of July reached the highest market price...

HALE & NORCROSS—has lately been sold to a considerable extent at a very great decline. During the first six months of the present year this stock seldom made its appearance in the market...

CHOLLAR-PORTER—has been very active during the period under review, and the favorable developments have given it more than its proportionate share of the attention of the market.

YELLOW JACKET—rose to \$200 early in June, fell to \$50 in July, improved to \$110 in August, and closed in September at \$340. The dividends of this company during the past nine months...

GOULD & CURRY—has been comparatively quiet during the entire period under review, selling within a range of \$50 to \$80 per foot from January to the close of August at \$25, falling to \$300 in September, and closing at \$235.

CHOLLAR-PORTER—has been very active during the period under review, and the favorable developments have given it more than its proportionate share of the attention of the market.

EMPIRE—rose to \$202 per share in April, then sold within a range of \$160 to \$185, and closed yesterday at \$190.

KENTUCK—came into the market in May, selling at \$180, rising at the close of June to \$260, dropping to \$154 in September, and selling yesterday at \$245.

GOLD HILL QUARTZ—ADVANCED M. & CO.—was placed on the market in the spring at \$200, and advanced to \$240 at the close of July, fell to \$180 in August, and sold at \$175 in September.

SOAP FACTORY.—The new establishment of Messrs. Lucy & Hymes, at the corner of Eighth and Brannan streets, is said to be the largest of the kind on this coast.

ELECTION OF OFFICERS.—NORTH STAR G. M. Co.—October 9th. Trustees, A. C. Peachy, Delos Lake, A. J. Pope, W. H. V. Cronise, G. W. Beaver.

constitute the burden of dealings on the Stock Exchange; but not all parties have the same view of such a thing.

That these mines should be operated more with a view to considerations of the future, that they should be preserved from the unhealthy influences to which they are now so largely subjected...

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Receipt; Day of Payment; Sale; and Amount and Time of Payment of Dividends.

Table listing mining companies, their locations, and details of assessments and dividends. Includes companies like Ancient River, Belcher, Chalk Mount, etc.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

Table of stock prices for various companies and bonds, including United States Bonds, California State Bonds, and local mining stocks.

RAILROADS.

Table listing railroad companies and their stock prices, such as Sacramento Valley Railroad, San Francisco and San Jose Railroad, etc.

BANKING INSTITUTIONS.

Table listing banks and financial institutions, including California Loan and Savings Society, Bank of California, etc.

INSURANCE COMPANIES.

Table listing insurance companies and their stock prices, such as Fireman's Fund Insurance Co., Pacific Insurance Co., etc.

MINING STOCKS—WASHE DISTRICT.

Table listing mining stocks from the Washoe District, including Alpha, Baltimore American, Belcher, etc.

San Francisco Market Rates.

Table of market rates for various commodities, including flour, sugar, coffee, and other goods.

Table of commodity prices for coffee, tea, sugar, and other goods.

Retail Prices.

Table of retail prices for various goods, including butter, flour, and other household items.

San Francisco Metal Market.

PRICES FOR INVOICES.

Table of metal market prices for various types of iron, steel, and other metals.

DEWEY & CO. PATENT AGENTS.

ENGRAVERS AND PUBLISHERS. Mining & Scientific Press. SAN FRANCISCO.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast.

THE GOLDEN ERA.

It is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of valuable and entertaining, Original and Selected matter.

Rates of Subscription.

Table showing subscription rates for one year, three months, and other periods.

Boiler Makers Wanted. WANTED—GOOD BOILER MAKERS, (THAT ARE NOT Society men) to whom steady employment will be given.

Boiler Makers Wanted. WANTED—GOOD BOILER MAKERS, (THAT ARE NOT Society men) to whom steady employment will be given.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Oct. 5th: The Silver Creek mill will start up next week again on Tarshish ore. The proprietor was obliged to take the broken iron work to Virginia City for repair, which has caused a vexatious delay.

In the down shaft of the Tarshish, better ore is being found than any before seen in the mine. This shaft is going down at a rapid rate, water not interfering so far with the working.

## Amador County.

*Ledger*, Oct. 5th: The Coney mine has been stopped for repairs and for the purpose of erecting an engine on the shaft. It will require five or six weeks to complete the contemplated improvements and alterations. We were shown two bars of gold at the assay office of P. Reichling, the result of the last 28 days run of the mill. They measured 6 in. by  $2\frac{3}{4}$  and  $1\frac{1}{4}$ , or  $4\frac{1}{2}$  cubic inches, weighing 427 ozs., and worth \$8,186.50. One of the bars, 210 ozs., was gold from the mill, and worth \$17.80 per ounce. The other, 217 ozs., worth \$20.50 per ounce, was from the sulphurets reduced by chlorination.

Old Bob's claim, located in Walker's Ranch, is looking fine. They are now down 58 ft., and have two distinct veins of promising rock.

## Inyo County.

*Virginia Enterprise*, Oct. 1st: Mr. M. L. Remington, who built the Janin & Park mill, will leave this city in a day or two for Pine Grove, Wilson Dist., to make arrangements for the erection of a mill in that region. Mr. Remington thoroughly understands the art of mill building.

The 11,160 ozs. of hullion from the Kearsarge mine, mentioned in the last issue of the Press, was the result of a crushing of 40 tons of second class ore, instead of 70 tons. The *Virginia Enterprise* says that they have ores in the Kearsarge that yield as high as \$800 per ton.

## Los Angeles County.

*News*, Oct. 4th: Daniel Sexton, Esq., of San Gabriel, has just received a patent for a new model of a quartz mill, by which machinists claim that one-half of the motive power will be saved. Mr. S. is now making arrangements to start a mill upon the new plan and patterns, by which a practical test will be made of the new invention. If what is claimed for it be true, the cost of quartz mining will be materially reduced by its introduction.

## Mariposa County.

*Mail*, Oct. 5th: The new quartz mill erected by Robinson & McAllister on their vein, (formerly the Potts vein,) in Hunter's Valley, is nearly completed, and will be started up next Monday. It contains 12 stamps, has all the modern improvements, and is the most complete mill in the county.

## Mono County.

The Munckton correspondent of the *Virginia Enterprise* of Oct. 1st, in describing the newly discovered Dunderberg lode, says: The lode is from 15 to 20 ft. wide, and its east casing is granite, while the west is slate, which is good evidence of a fissure vein. The ore, of which there is 100 tons at the shaft, contains both gold and silver, the former predominating, and of which I have tried all classes, from one side of the ledge to the other, and from the showing of the horn, after pulverizing, as well as from the test tube, I am free to say that from the uniform results the entire lode will work \$100 per ton.

The same paper says: We were yesterday shown by Dr. Munckton and Mr. Thompson, of Carson City, some results obtained from the Dunderberg mine, Castle Peak Dist., about 25 miles southeast of Aurora. An assay of the ore, made by E. Ruhling & Co., shows it to contain \$159.32 per ton—gold, \$100.46; silver, \$58.86. A lot of ore from the same mine, worked by regular mill process at the Merrimac mill, yielded at the rate of \$102.85 per ton.

## Nevada County.

*Gazette*, Oct. 5th: The Marietta ledge is five feet wide, and the rock so easily mined that one man keeps the five-stamp mill running night and day. The mill is new, is run by a hurdy-gurdy wheel, and the cost of mining and working the quartz does not exceed \$3 a ton. The quartz shows a great deal of free gold and sulphurets, and there are very few mines in the county yielding better pay. The company own another very large ledge near the Marietta, on which they contemplate erecting a mill next season.

Oct. 7th: Quite a serious accident occurred in the claims of the Eagle Co., at Relief Hill, lately, which will detain them from

working for some time. They had run a new tunnel to tap the deposit at the lowest point in the channel, and sunk a shaft to connect with the tunnel through a hundred feet or more of bed-rock. The rock was so solid it was supposed the shaft would stand without timbering, but they had only been working a few days when the upper part caved, thus forcing them to suspend operations. They are now engaged in reopening the shaft, commencing at the surface and curving it in a substantial manner as they go down.

The big blast, now being prepared in the claims of the Union Co., will be ready for firing in about ten days or two weeks. This will be the heaviest blast of the kind ever set off in the State—750 kegs of powder being used.

Oct. 8th: Kerr Phelan & Co., who have acquired by purchase and location the claims on Shady Creek, have made arrangements to work the same by means of drifting. The creek is filled with tailings to a depth of 25 or 30 feet, washed down from the claims at Cherokee and Chimney Hill, and have become packed as solid as the old gravel deposits. These tailings have been tested sufficiently to show that they will pay well for working, those lying on the bottom, especially, being very rich, but they cannot be worked by the ordinary process of sluicing for the lack of fall. Phelan & Co. have erected a wheel for pumping and hoisting, and intend to drift out the gravel along the bed of the creek.

The new mills of the Commercial and Birchville Cos., as well as the Black & Young mill, and the arastras of Booth & Co., at Enreka, are running steadily, and are doing a good business. Miners are at work opening new ledges, the most of which show favorable prospects.

*Transcript*, Oct. 3d: The Scandinavian Quartz Mining Co. determined at a recent meeting to incorporate, and the officers were authorized to take the necessary steps. A contract is to be let for running 100 feet of tunnel upon the claim. The mine, as far as opened, looks exceedingly well.

Oct. 4th: The mines about Eureka are turning out splendidly. A large amount of prospecting is being done, and the mills are kept at work. The older mines are still doing well, and several new mills are being erected. Eureka promises to be one of the liveliest mining camps in the county. The Birchville Co. has just completed and started their new mill.

Oct. 5th: The five additional stamps ordered for the Grizzly mill, some time since, passed through this city yesterday. The mine has proved so good that the mill, with ten stamps, can be kept in constant operation. For the last two runs the yield has averaged \$100 per day, with five stamps.

"Blaze" has a handsome case, containing 16 small vials, which are filled with specimens of gold dust from the different localities in the county. The specimens vary in fineness from the smallest grain to the size of ordinary beans. They present a very handsome appearance.

A fine specimen of float rock was found a few days since, out beyond Maltman's sulphuret works, on the ridge. It weighed several pounds, and was filled with galena, in which gold could be seen. The party who found it supposes it was broken from a ledge in the vicinity.

Oct. 6th: The Ben. Franklin ledge, on Franklin Hill, a short distance from the Lone mill, is destined to be a big thing to its lucky owners. The *National* says a perpendicular shaft has been sunk on the ledge 86 feet, from which drifts have been run 100 feet, both north and south. Dan. Tierney & Co. have contracted with the owners to take out rock, and they are bringing it to the surface as fast as it can possibly be taken out. A short time ago 75 tons were crushed at Ben. McAuley's mill, in Boston Ravine, which yielded \$86 per ton. The ledge varies in thickness from 12 to 18 inches.

Oct. 8th: We saw, on Sunday, a beautiful specimen of quartz gold, from the Empire mine. The specimen consisted of a small piece of rock, out of which shot a crystalline mass of pure gold. The beautiful crystals glittered in the sunlight like diamonds, and on being held up, rays of light could be seen through the openings between the crystals of gold. The gold was almost pure for an inch and a half in width and two in length. It was about an eighth of an inch in thickness.

*Transcript*, Oct. 9th: The Commercial Co. have recently completed a 10-stamp mill, which is now running. The ledge is excellent, and the rock pays from \$15 to \$20 per ton.

The Birchville Co. have just completed a 5-stamp mill. Their rock averages \$30 to the ton.

The Golden Age ledge has been opened,

and a large amount of rock has been taken out. No crushing has yet been had.

The Liberty ledge has been opened 100 ft. The rock pays from \$15 to \$20 per ton.

The Reasoner Bros. have a fine ledge, upon which they have opened 120 feet. The rock last crushed paid about \$12 per ton.

The Banberry ledge is opened to the depth of 30 feet. It pays \$30 per ton. About 300 tons have been worked in arastras.

We saw yesterday, at Carley & Beckman's saloon, a piece of rock taken from the Scandinavian ledge, which weighed two pounds and ten ounces, and was hespangled on every side with free gold.

## Placer County.

*Herald*, Oct. 5th: Yesterday Mr. McCarty showed us a piece of rich rock taken out of Wall & Co's claim, near O'Brien's. The company on Wednesday last took out \$600. The ledge is from 8 to 14 inches wide. It is entirely in slate.

Mc. also showed us some rock taken from the "Gorham" ledge, which is about  $2\frac{1}{2}$  feet wide and runs parallel with the "Black Ledge" about 500 feet east. The rock is very similar in appearance to the rock from the Black lead, and carries plenty of free gold.

The Green Emigrant is still producing as well as ever.

Since the recent rich strikes on Quartz Flat many more claims have been taken up.

## Shasta County.

*Courier*, Oct. 5th: The mines on the North Fork of Cottonwood are paying unusually well. Two claims were cleaned up a few days ago, after a run of several weeks, which paid from \$10 to \$15 per day to the hand.

On the South Fork, the striking of rich prospects in one ledge, has led to the commencement of work on a number of others.

## Sierra County.

*Downieville Messenger*, Oct. 5th: A rich quartz ledge has been discovered at Cold Spring ranch, near Plum Valley.

The north extension of the Docile Co's ledge are taking it out rich—pounding only the selected rock in mortars and getting \$30 or \$40 per day to the hand. The owners are working within a few feet of the surface.

Five hundred ounces of gold are reported to have been taken from the Docile quartz ledge, at Alleghany, last week, the work of three men. A much larger amount is supposed to have been the true yield.

Efforts are being made to induce parties in New York city to develop the vast deposits of iron near Gold Valley.

## Siskiyou County.

*Yreka Journal*, Oct. 5th: The mines on Soda Creek are yielding good average wages—as high as \$4, \$6 and \$8 per day.

## San Bernardino County.

*Guardian*, Oct. 5th: Parcot & Co., in Holcomb Valley, have sunk a shaft and struck the bedrock; they are now running a tunnel, searching for the channel, as it is supposed in the wash is deposited the heavy gold. When struck it will be found rich, as the fine gold is obtained on the surface and all the way down. The steam pump continues working to perfection.

Wade & Co. are engaged in placer mining. Their little engine, the "grasshopper," will be ready for work in about a week.

In Van Duzen cañon there is a company of four men who have done a great deal of work, in the way of prospecting. They have struck gravel, and think they are on the channel.

In the Green quartz lode, work is progressing; they are down about 300 feet, and getting some very rich rich rock.

The news as to the success of the projected water works, on Lytle Creek are encouraging. Several claims have been bought up, and hydraulic washing is making its way through the red clay at a decidedly paying rate.

## Trinity County.

*Journal*, Oct. 5th: A correspondent writes from Minersville that Peter Van Matre picked up a \$56 nugget in his East Fork claim the other day, and that Hugh Markey cleaned up 32 ounces as the result of 24 days work in his Gassy Hill claim. Two Cornishmen, who have been drifting into the mountain opposite French Gulch for some time, picked up a \$13 piece one day last week.

## Yuba County.

*Marysville Appeal*, Oct. 5th: The Brown's Valley mills have machinery attached for saving sulphurets. They are said to be rich, and are sent to Grass Valley for working. We heard some time ago that sulphurets from the Pennsylvania mill assayed as high as \$1,600 to the ton.

The late strike in Brown's Valley was in the Rattlesnake mine. The Donnebroke mill is crushing from it and the rock pays

well. The gold is coarse, rock hard and expensive to mine. The Jefferson Co. continues to turn out rich rock. The Donnebroke mine is about to resume work on its own rock.

## ARIZONA.

*Miner*, Sept. 12th: On account of the scarcity of water in the Hassayampa, Mr. Smith will suspend operations as soon as he can clean up his arastra. He has recently discovered a new lode, which he has named the Sinclair.

Mr. Lewis informs us that "Shep" and Billy Middleton, two intrepid miners of Lynx Creek, have struck it rich opposite Clark's old cabin at Walker's. The arastras on the creek are idle for want of water, but the boys are still getting out ore.

At Walker's Camp on Lynx Creek, Poland and McCrackin are taking out ore from the Post Oak and Deadwood No. 2. These two ledges have, and are still furnishing plenty of first class rock. The Deadwood No. 2 has paid as high as \$48 to the ton in free gold. The Post Oak has also paid well. Messrs. Poland and McCrackin have erected an 18 ft. overshot water wheel, with which they drive their arastras.

Uncle Billy Pointer, a man of great age and energy, has a lode named the Pointer, which is very rich. The old gentleman has taken out of it, with his own hands, several tons of rock, which he thinks will pay better than an equal quantity of rock from any other lode in the country.

A party of miners are getting ready to smelt galena ore from a lode called the Spur, which is said to contain lots of the precious metals. A few companies are placer mining, making fair wages. Mr. Pearson, recently, in one day rocked out of a hole two feet square the sum of \$18.

Good and extensive diggings are reported in the neighborhood of San Juan Mountain. In one gulch at the depth of 15 ft., 25 cts. in coarse gold to the pan was obtained.

Noyes & Co. have 18 men employed in prospecting and taking out ore for the Aztlan mill, in the Hassayampa Dist. They are taking rock out of the Montgomery and other lodes.

## BRITISH COLUMBIA.

*Cariboo Sentinel*, Sept. 9th: Messrs. Dietz and Claudet have just returned from the Cherry Creek silver mine. The latter brought down with him a lump of ore, 54 lbs. in weight, which had been broken from a section taken from the lead, 150 lbs. in weight. It is of the rich blue ore.

The result of the last week's work on Williams Creek is as follows: Old California Co. 35 ozs.; Aurora Co. 278 ozs.; Forest Rose Co. 46 ozs.; and Ruby Co. 70 ozs.

Stout's Gulch: Alturas Co. 176 ozs.; Taftvale Co. 251 ozs.; and Mucho Oro Co. 40 ozs.

Mosquito Gulch: Job Co. 4 ozs.; Willow Co. 12 ozs.; and Jeffree Co. 36 ozs.

Grouse Gulch: Ne'er do Well Co. 80 ozs.; Heron Co. have declared a dividend of \$100 to the share.

The Dominique Co. on Nelson Creek, are making \$25 per day to the hand.

Work has been suspended on the ledge of the Washburn Quartz Co.

Terry creek is nearly abandoned; six white men are all that are working there at present.

There is about 10 Chinamen working on a small stream that empties into Government Creek, in which they make small wages.

## COLORADO.

*Georgetown Miner*, Sept. 19th: The hands on No. 1 Gregory lode lately struck several rich pockets of gold bearing specimens. John Martin and Sam Scott have discovered a fine sulphuret bearing lode on Alpine Mountain. Ore is being packed from the Astor lode to Garrott, Martine & Co's works. A dirt crevice has been struck on the North American lode, assays from which yield \$180 to the ton. Two men can take out four tons per day. Martine & Co's works are running 20 tons from the Coin lode.

We saw a splendid piece of retort this morning at Warren Hussey & Co's bank. It was from  $3\frac{1}{2}$  cords of ore from the Oro Cache lode near South Boulder, and weighed 64 ozs. 9 pwts. and 12 grs., value \$1,750 currency. This result was obtained by Messrs. Frothingham & Jones, by means of a Dodge cracker, Rotary crusher, and Ball polisher, and afterwards amalgamated in Hepburn pans.

Denver *News*, Sept. 25th: Duhois mill at Black Hawk, has been destroyed by fire. Loss \$25,000. Placer diggings in Colorado Gulch are paying \$25 per day to the man.

We saw at the Colorado National Bank, this morning a bar of gold bullion from Cherry Creek dust. Its weight was 10 56-100 ozs., fineness .992 $\frac{1}{2}$ , value \$217.27.

A diamond very white and clear, and about the size of a hen's egg, is said to have been found in Denver, 40 ft. below the sur-

face in the gravel drift.—[Likely—EDITORS PRESS.]

At the United States mint this morning were two bars of gold bullion, from dust from the Cimeron mines on the northern borders of New Mexico. They each weighed 145 75-100 ozs., fineness, .875½, value of each \$2,660.61, being a total of 291¼ ozs., and \$5,321.22.

#### IDAHO.

*World*, Sept. 28th: A discovery has recently been made on Bummer Hill, of a ledge of the same species of rotten, decomposed quartz, as that found in the noted Growl and Go ledge beyond Placerville. The newly found ledge prospects exceedingly rich, and its discovery created no little excitement in and about Centerville.

The Big Ditch which supplies the hill, gulch and bar diggings about Pioneer, and which is being extended to Bummer Hill and Granite Creek will be completed before winter sets in.

*Owyhee Avalanche*, Sept. 28th: H. B. Morse is running the Cosmos mill on North Star ore with a prospect of paying well. About 150 tons of ore is at the mill.

The Minear mill is still running on ore from the Ida Elmore mine.

Col. Fogus has opened another rich ledge on the summit of War Eagle Mountain. It is well defined and shows on the surface a width of about 15 in. We were shown pieces of the croppings, a considerable portion of which is black sulphurets of silver interspersed with particles of gold plainly visible.

In Flint Dist. operations are quite brisk. The Black mill is now employed on Leviathan ore. The Iowa mill is nearly completed, and will be well supplied with Rising Star quartz. This mine has been leased to the Iowa Co. for a limited time. General McQueen is giving employment to a force of men in the mine day and night, and will ere long have several months' supply of pay ore out. The ledge at the point of present work is 15 ft. wide, and in taking it out makes a shaft wide enough for a double set of miners and two windlasses overhead. There being such an immense quantity of quartz, only a very rich quality is treated as first-class, and the remainder as second and third class.

#### MONTANA.

*Post*, Sept. 21st: A 15-stamp mill has arrived for the Hot Spring Gold and Silver Co. The mill was built at the Western Foundry Works, St. Louis.

Taylor, Thompson & Co., Holloway & Lindy and Gerwitsch are working a bank of gravel in their claims in Last Chance Gulch which averages 20 ft. in depth, and runs \$200 per day to the sluice, with no bed rock.

Claims on El Dorado Bar are looking up; they now command from \$500 to \$1,500, and ready sales are found at these rates.

A new gulch has lately been discovered by Col. Woods on the head waters of Salmon river, and has been named Dahlenega. It prospects well.

The new diggings on Thompson's river are attracting considerable attention. Report says that the diggings are good, with plenty of water.

John Simonds and Henry Augustine lately sold 80 ft. of claim, No. 1 west from the discovery on the Whitlatch Union lode, for \$10,000.

Sept. 28th: Some 60 contiguous claims in Alder Gulch, in Summit and Pine Grove Districts, with a bed-rock flume 1,700 ft. long, sluices, mining tools, water ditches, rights, privileges, etc., which cost over \$13,000, were lately sold at sheriff's sale for \$6,500, greenbacks. The property was considered worth \$30,000.

Prof. Chas. Rumley, of this city, from 12 ounces of rock assayed 3 ounces and 15 pwt. of silver, 919 fine, being at the rate of \$10,826 96 per ton. The rock comprised a few picked specimens from the Rumley & Bucher lode, on Flint Creek. The Professor has obtained much larger results than the above from the same lead. A short time ago he assayed a piece of ore which went something over \$30,000 silver and \$100 gold per ton. The extent and richness of this lead is probably unparalleled on this continent, or, for that matter, in the world. It is now uncovered for a length of 600 ft., showing a well defined crevice averaging six feet in width.

The Highland correspondent writes as follows: "The Only Chance is owned by Nevins, Flower & Co. The first clean up from this lode from arastra was \$363; second, \$1,036 80; third, \$1,338 20. Each run—one week—was made from Nevins' lode; the result was 48 ounces; about the same amount of rock. Our gulch diggings have not equaled our expectations. Yet a large amount of gold has been taken from our diggings. I know of a number of fortunate ones who have gone East with from \$3,000 to \$5,000 each, and we yet have good ground."

The new mines at Libby, near Tobacco Plains, are reported to be rich. The gold is fine, resembling Alder Gulch dust. The pay lies shallow on slate bed-rock; water and wood are abundant, and from pannings from \$7 to \$18 are said to have been realized per day. This is the story of one returned from there. Since penning the foregoing, four Bear Gulch miners have returned from Libby, and in unqualified terms pronounce these new mines the biggest "hik" of the country.

#### NEVADA.

##### Black Rock.

*Butte Record*, Oct. 5th: Certificates of incorporation of the Chico Gold and Silver Mining Co., and the Black Prince Gold and Silver Mining Co., were filed in the Clerk's office of this county on the 26th ultimo. The claims of these companies are situated at Black Rock, the ores of which were recently tested at Dall's mill. A quartz mill is now on its way to that locality, and it seems not improbable that Black Rock may yet prove as valuable as the Comstock lode.

##### Esmeralda.

The *Virginia Enterprise*, of Oct. 4th, calls the attention of miners and millmen to the advertised sale of the Brick mill, and the Tucker & Stark wooden mill, on Bodie's Gulch, near Aurora, Esmeralda Co.

##### Humboldt.

*Unionville Register*, Sept. 28th: A shaft has been sunk on the Calaveras lode, and a body of fine black sulphuret silver ore has been drifted into 16 ft. without reaching the hanging wall. This ore yields \$210 silver per ton of 2,000 pounds of ore.

Patents have been applied for for the Starlight and Midas lodes. The Starlight has a shaft 30 feet deep, at which depth a well defined vein of ore, 10 feet wide, is exposed to view, which yields \$44 silver to the ton at the mill. The Midas is a gold-bearing vein, 2½ feet in width at the depth of 30 feet, and yields \$147 gold per ton.

The Golconda mill is now in motion on ore from the Golconda mine. The first run of 30 tons of ore gave a yield of \$50 to the ton, which is very flattering, as the quantity of ore is unlimited and can be mined at small cost, the lode being very large, all metal, and much decomposed.

The new mill of the Summit Co., Vicksburg district, was started up last week on ore from the Spring ledge. The first run was entirely satisfactory, giving a very handsome return of bullion for the amount of ore worked.

##### Reese River.

*Reveille*, Oct. 1st: The mill of the Old Dominion Co. is working very successfully. The first ore crushed in the battery was a lot of second class from the Old Dominion mine, the pulp of which assayed \$150 per ton. They were about to work some 15 tons of the first class ore, the estimated yield of which was very high. Great masses were obtained from the mine which exhibited an unusual amount of horn silver, the characteristic surface ore in the district. The developments on the Old Dominion ledge were of the most extraordinary character, and bid fair to furnish the mill of the company with a full supply of ore. At the depth of 20 ft. in the incline there is a vein of pay ore 12 ft. thick, the whole mass of which may be carried to the mill with substantial profit.

A large lot of ore which was taken to Hot Creek from the Morey District for reduction in the mill of the Old Dominion Co., has given a yield of upwards of \$200 per ton by an assay of pulp. The owner of the mines in the Morey District has contracted with the mill for the delivery of 100 tons of ore.

We learn that Col. Catherwood was so highly pleased with the appearance of the Silver Champion mine that he bought and shipped a mill from Aurora, which is to be erected immediately at Palmetto. The Silver Champion has been opened to the depth of 65 ft., and has produced a considerable amount of good looking ore, a specimen of which was shown to us. Mr. Stansberry showed us also two specimens from the Lodi and the Nevada ledges, owned by him, which assay high. The ore contains a large proportion of gold.

Oct. 2d: The mill of the Centenary Co., in Newark District, was set in motion on the 25th ult. The first ore crushed was an inferior grade from the Chihuahua mine of the company, the pulp of which assays from \$50 to \$75. At present the battery is crushing the ore wet.

By the stage which arrived from Belmont on Saturday evening three bars of bullion were brought from the mill of the Belmont Co.

Oct. 3d: A large body of very rich ore has been developed in the Murphy mine of the Twin River Co., which is said to be superior to any hitherto exhibited in the mine. In the very partial development of the Murphy, several "chimneys" of great extent

have been encountered, which have produced ore of a high grade.

Oct. 4th: This afternoon some 30 large bars of bullion from the Manhattan Co. were delivered at the office of Wells, Fargo & Co., but the circumstance received no more notice from the passers than would a load of bricks.

We were shown a box of specimens taken from the Reality ledge, Washington district, which exhibits the characteristic mineral of the district. It is distinct from that produced by the greater number of the districts of Eastern Nevada, and is mainly an argenticiferous galena, rich in silver. Ore of this character appears to be inexhaustible in quantity. The veins are generally large and regular in their formation, and vary from 4 to 15 ft. in width. Several attempts have been made to reduce the ores of the district, but they failed through lack of skill of the operators. The ore exists in immense masses, and it is the judgment of competent authority that it could be readily and economically smelted, or reduced in a furnace of the proper construction.

The greater portion of the miners who left the White Pine district for the Goose Creek gold mines, have returned, and are working their claims. The Uncle Sam, Philadelphia and Vanderhilt are being worked.

The Monte Christo Co. is working one of its mines called the Mohawk with considerable vigor. The machinery and nearly all the materials for its five-stamp mill has been on the ground some time, and workmen are rapidly giving them the form of a practicable mill.

Joe Williams, one of the most successful prospectors in the State, has returned from a tour to the southward, after an absence of 30 days. He discovered and located eight ledges of silver and gold-bearing ore, samples of which he brought into town for assay. Mr. Williams thinks the locations were made upon the boundary line of the State, in which they are situated as well as in California. He pronounces the ledges, as far as size and general appearances are concerned, to be the very best he has yet discovered. Several of the samples of quartz exhibited free gold. Mr. Williams stopped at San Antonio, where Rigby was pushing work on the Liberty mine to great advantage. His small mill had been repaired and was running, but was to be replaced shortly by one of greater capacity.

Oct. 5th: The Ware mill, worthless for the reduction of silver, and which has been idle for a long time, is to be taken down and removed immediately to the district of New Pass, 25 miles west of Austin. The purpose of erecting the small 5-stamp mill in the district is to test the quality of the ore thoroughly. If the result should be satisfactory, it is the intention to erect a mill of greater capacity.

*Silver Bend Reporter*, Oct. 5th: The new mill at Hot Creek is now in successful operation. The first ore crushed in the battery was a lot of second class from the Old Dominion mine, the pulp assay of which was \$150 per ton. A lot of Morey ore gave a pulp assay of over \$200 per ton. There is also considerable ore on the way to the mill from the mines of Reveille district.

From 2½ tons ore from the Highbridge mine, Reveille district, worked by J. W. Varney at the Faulkner mill, the yield was \$381 per ton.

In the Potosi mine the depths already attained yield convincing proofs of its richness and permanency. The ore from this ledge, by an assay of the average, has lately yielded the sum of \$200 per ton. The claim, at its present depth, can without doubt be reckoned among our first class mines.

*Trespass*, Oct. 2d: We saw a large lot of machinery, this morning, which is to go to Belmont for a mill now in process of construction for the Combined Co.

*Enterprise*, Oct. 3d: The late results obtained by assay and mill process from the Dunderberg mine, near Monoville, were entirely satisfactory, showing over \$150 per ton; but they have since had assays of ore from their lead showing over \$200 per ton. The company has taken steps to erect a mill at an early day.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

*Virginia Enterprise*, Oct. 1st: The new Janin & Park mill, for the reduction of blanket washings, started up last Tuesday, and day before yesterday made their first clean-up, obtaining 266 lbs. of clean amalgam from 41 tons of washings. The machinery of the mill is driven by a 25-horse power engine and consists of six flat-bottomed pans, each containing 13 shoes and three attlers, each eight ft. in diameter. The blanket washings—concentrated tailings—operated upon were from the Regna &

Wheeler flume. Janin & Park have a long string of flumes of their own, but the capacity of their works is such that they find time to do much work for other flume companies. The mill is the finest running little mill in the State.

Oct. 2d: The owners of the old St. Lawrence mine are about to resume operations upon the lead. An engine will be placed on the ground with which to do the hoisting from the shaft. The lead of the company yields ore that prospects exceedingly well. Work will also shortly be resumed on the Old Emigrant claim, below Silver City.

The Sierra Nevada Co. have encountered very hard blasting rock in the drifts they are running, therefore the progress made is necessarily slow. They have drifted beyond the point where they encountered the body of water last winter that drove them out. At that time it was supposed that the casing of a large lead had been cut, and the stockholders entertained great expectations; now, however, it is known that the rush of water came from a large streak of loose, shaly rock, which formed a pocket or subterranean reservoir far below the surface. Undismayed, the company are still pushing ahead, hoping eventually to strike the Comstock vein.

Oct. 5th: The amount of bullion shipped from Wells, Fargo & Co's office in Silver City, for the month of September, was \$28,050.

During the past week, Wells, Fargo & Co. shipped from their office in Virginia and Gold Hill, 6,533 lbs. of bullion, valued at \$164,461.72.

*Trespass*, Oct. 2d: The Union mill, Gold Hill, is now being repaired and made ready for the coming winter's labor. Two new pans, Knox patent, are to be added to the amalgamating capacity, and new settlers, vats, etc., will be built, when the Union mill will be ready to resume reduction of ores.

Of late there has been much talk indulged in of the danger of some of our best mines being closed by a cave. It is all nonsense. There is no danger of such a catastrophe, and none has ever been apprehended by those best informed.

Oct. 5th: The Petaluma mill run 20 days during the month of September on Kentucky ore, crushing 900 tons, yielding \$46.18 per ton. The mill is now crushing 55 tons per day of Kentucky ore.

#### OREGON.

*Jacksonville Sentinel*, Sept. 28th: Last week, Mr. Oliver brought from a ledge on Grave Creek a load of quartz rock—about 1,500 lbs.—to the mill on Jackson Creek. Col. Drew crushed it this week, and obtained \$14.87, very fine gold. At this rate it will pay nearly \$20 per ton. No gold is visible in the rock. We understand it is the intention to test the ledge further, and if sufficient encouragement is met with, a mill will be erected on the ledge.

Parties are leaving town nearly every day for the mining district, between the North Umpqua and Willamette rivers. It is credibly reported that average specimens assay \$180 to the ton.

Col. Butterfield, who is sinking on a bed of cement near Waldo, is sanguine that the cement will pay for crushing, and has ordered machinery for that purpose. A few boulders and some gravel has been struck in the bottom of the tunnel, but the cement still continues.

**Changing the Address.**—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. ... at ... P. O. ... County, ... State, to Mr. ... at ... P. O. ... County, ... State. .... 186-"

#### Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thanks for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness:

GEORGETOWN, January 23, '67.  
MESSRS. DEWEY & Co.—Sirs: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Letters Patent" on my application through you for an "Improved Machine for Washing Ores." It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf.  
Very truly yours,  
M. A. WOODSIDE.

#### BEAN'S HISTORY AND DIRECTORY —OF— NEVADA COUNTY, CALIFORNIA.

Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources.

## Notices to Correspondents.

PONTIAC.—Cast Iron was the first form in which that metal was employed in bridge building. French and Italian engineers were the first to pay marked attention to the use of this metal in such constructions, and made several unsuccessful attempts for its introduction abroad, wholly owing to the then inability of foundries to cast large segments. The first attempt was made at Lyons, in 1855, and one arch was put together in the builder's yard; the project was abandoned as too costly, and timber employed. The first permanent construction of this kind was made at the suggestion of Mr. Darby, the original founder of the celebrated Coalbrook Dale Coal and Iron Works in England. A bridge across the river Severn being required near this place, it was resolved to try the experiment of a bridge of cast iron, having a span of one hundred feet. It was a bold design, well executed; an error, however, was committed by treating the arch as an equilibrium, the abutments proving defectively weak were forced inward by the pressure of earth behind them, in consequence of which the arch was partially fractured. Nevertheless the bridge proved serviceable, and continues so to the present day. The next successful design for an iron bridge was based upon and eventually constructed on calculation and models made by the celebrated Thomas Paine—the publication of whose pamphlet, commencing, "These are the times that try men's souls," forms so memorable an era in the history of American Independence. Next week we will furnish some particulars respecting this remarkable bridge which was originally designed to cross the Schuylkill.

CABALLERO, Los Angeles.—Is desirous of more attention being called to the improvement of horses and pack animals generally, wishing, at the same time, that the great capabilities of the southern counties of California for this object should not be overlooked. We would suggest to any one entering upon such an enterprise, the advantage that would be derived by crossing the native California breed by importing a fine Arab stallion. To make the point better understood, we subjoin the following brief description of the horse of the desert: The Arab horse is small, not rising in general above fourteen hands one inch, but they are firm and have great power and size for their height; limbs flat, broad and powerful, deep below the knee, small and fine about the fetlock, with a clearness and beauty of outline, alone sufficient to stamp the term *blood* on its possessor. The neck is high yet arched, the flanks closely ribbed up, the tail carried out with a sweep, like the curve of a palm branch; a small head is terminated by large nostrils, maintained continually in motion, snorting and neighing. Colors—gray, of various shades, brown, bay and chestnut, are the ordinary—in fact it may be said are the only colors of Arab horses—a utraque gray being the commonest variety; chestnut, however, is the most esteemed.

## Overland Railroads.

The aid which the press of the Pacific coast is ever ready to lend to every new home industrial enterprise, has often been noticed and commended abroad. But this aid should only be granted where the enterprises are *bona fide*, and when they do not promise to cripple similar enterprises already existing, which fully supply all reasonable demands, and which deserve to be cherished, rather than to be made to suffer loss by a supply that is ahead of the demand.

The subject to which we would call attention, in connection with the above matter, is that of the Pacific Railroad. As the readers of the Press are aware, a through continental road is being pushed across the country by two companies, over what is known as the Central Route. No great enterprise was ever placed in more energetic hands, than this one is. The Union Pacific company on the Atlantic, and the Central Pacific company on this side, are pushing the great work ahead toward the center of the continent, at a rate altogether unparalleled in such enterprises, especially when we consider the great difficulties in the way. The road, it is promised, will be completed in 1870.

Now, with a population of only one million of people, on this side of the Rocky Mountains, with dozens of local railroads urgently needed and remaining unbuilt, and with hundreds of other legitimate enterprises untouched, calling for development, is it not absurd to talk of building any more through Pacific railroads, for the present, at least? The Government has aided the road now being built, largely, by granting it lands and lands; but is it consistent with the economy, so urgently called for at present, with justice to other enterprises requiring governmental aid, with good sense and the necessities of the coast, to ask national grants to all the Pacific Railroads that are laid down—*on paper*—by speculators?

One road will prove amply sufficient to accommodate all the business that will be offering for years to come; and even if only a second road was now built, the result would be that neither would pay. Lofty talk is indulged in with regard to the immense trade to be developed by a continental road; but this has yet to be proved,—and when one road is burdened with traffic, surely it will be time enough to build a second, and then a third, when needed. And, surely, too, it is but fair and honest that the pioneers who push through the greatest work of the age, should be allowed to derive a fair income from it at the start, and not see their profits run away with, as well as that of their opponent, by the establishment of the latter.

To build another Pacific Railroad would cost about \$175,000,000. Is there a man on the coast who will not admit that there are hundreds of uses to which such an immense sum of money could be much more profitably put, than in such a foolish enterprise? How much more profitably, too, could the labor of the vast requisite industrial army be used, than in building, at the present time, even a second through road.

Each of the half dozen Pacific Railroads, that exists on paper, claims to have the best and easiest route. But prejudice or falsification, it is well known, alone give each these seeming benefits. The Central Route was chosen in preference to all others, simply because it lay along the great lines of travel, population and natural wealth. Each one of the other routes is known to be more or less deficient in these requisites. It is claimed that the building of each road would develop or supply these wants. But have we the money to prove this at present? and even if we had, would it be prudent to risk it in what is known to be an uncertainty? Besides, while many on this coast have honestly given their countenance to a second or a third through road, it is well known that

the chief spirits engaged in these undertakings reside at the East, having little or no interest here, and that selfish speculation in franchises, which they hope to secure, is the only object they have in view. Of this fact developments connected with Fremont's and Levi Parsons' late *fiasco* with the Southern Pacific road, afford a noticeable example.

The people of this coast generally have not the money to subscribe to the stock of the road at present being built, and purchasers have to be sought abroad; but these purchasers will in vain be sought, if the stock of a second or a third through road is thrown upon the market. We claim, and we think we have foundation for the claim, to be second to none on the coast in our desire to aid each and every legitimate enterprise here. But we have no hesitation in saying that, *at present*, a second through Pacific Railroad is not a necessity. When we have added another million to our population, built all requisite local railroads, and made some approach to developing the hundreds of our natural manufacturing and commercial resources, that are now so loudly calling for aid, then the talk of building additional roads will be in order. At present, we may well be reasonably satisfied with the flattering prospects we now have of soon having one through road.

PURE ASPHALTUM.—Whatever may be the result of the search for petroleum on this coast, certain it is that a kindred interest of large commercial importance has in the meantime grown up, which, to a certain extent at least, has been incidentally promoted by efforts in the other direction. Considerable deposits of asphaltum, of different degrees of purity and value, have been discovered from time to time, more particularly in some of our southern counties. Prof. Whitney, in his geological report of the vicinity of Los Angeles, represents the pure bitumen as oozing from the earth's surface in the form of "tar springs," frequently covering an area of from ten to fifteen acres, and as hardening on exposure to the air into what is known as "brea," or asphaltum. Mr. Nouval, of the Pacific Asphaltum Co., No. 533 Kearny street, has laid upon our table some specimens from their mines in Los Angeles county, where the deposits are said to be almost unlimited, which appear to be nothing more nor less than pure bitumen, so free are they from sand and clay or other foreign matter. We understand that the asphaltum introduced here by this company within the last few months, commands from \$3 to \$4 per ton more than any other in the market, in consequence of its purity and freedom from rock, clay and other impurities. For a similar reason, sidewalks laid with it are said to be harder, and to wear better than when made from the asphaltum in general use, from the fact that the very large amount of tar called into requisition has a tendency to soften, under the influence of a summer's sun, and to render the character of the work less substantial—an objection entirely obviated in the article now offered to the public by this company. But little if any tar is required to fit this superior bitumen for effective service.

TELEGRAPHIC.—Our clients will be pleased to learn that we have received a telegraphic dispatch from our partner, Mr. Dowe, now in Washington, that the following applications for patents have been passed for issue by the Commissioner: Walter Pierce, Union Valley, Plumas county, "Rock Drill;" F. Morris, West Point, Calaveras county, "Amalgamating Process;" Mordcai Disney, of this city, "Car Coupler;" Daniel Hayes and Wm. Free, of this city, "Fire Escape;" Daniel Flint, of Sacramento, "Improved Farm Gate;" Messrs Rice & Leach, Union Postoffice, Merced county, "Driving Bridle;" E. G. Woodside, of this city, "Wheel Hub;" Albert Moore, of this city, "Shoes and Dies." We expect further dispatches, from time to time, until our long calendar of cases is fully disposed of.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

## Colorado vs. California at the Paris Exposition.

The wisdom of a thorough representation of the mining interests of Colorado at the Paris Exposition, has already been apparent. It will be recollected that our Colorado neighbors not only secured a fine and full collection of minerals for the Exhibition, but also dealt liberally with their Commissioner, Mr. J. P. Whitney. The consequence has been that the Colorado exhibition has been honored with the award of a gold medal, while the two mineral exhibitions of California have received only a silver medal each—Colorado carrying off the prize in a contest with California! More than this, through the funds furnished Commissioner Whitney that gentleman has been enabled to publish a full descriptive catalogue of his minerals, in pamphlet form; which publication has been considered of sufficient importance, in England, to be worthy of a republication there, and it has accordingly appeared, "magnificently printed, by a London house." The account before us adds that "it contains a schedule of the ores, some general information, and a beautiful map of the territory, and forms a beautiful close to the creditable representation of Colorado among the mining regions of the world, at the great Exposition."

As a further result of this "creditable representation," Commissioner Whitney will be accompanied on his return to Colorado by Mous. L. SEMONIER of the *Ecole de Mines*, and HERR HEINE, a distinguished German engineer. MONS. SEMONIER comes out to make an official report of the value of Colorado as a mining region, and will have his official letters published in the *Moniteur*, thus securing for them the best, most valuable and most influential circulation which such letters could obtain in Europe. HERR HEINE will write a series of letters for the German papers at Frankfurt and Cologne. These are some of the beneficial results accruing from a proper representation of an American Mining District at the Exposition.

An outlay of twenty, or even thirty thousand dollars, under any other circumstances, could not have done for California the half of what three or four thousand would have accomplished if that sum had been raised when it was asked of the citizens of San Francisco, by the late Exposition Committee of this city. Professor Blake, our Commissioner, went out empty handed, and almost unaided—the small amount that was finally raised for him came too late to be of any benefit whatever. A more able or a more proper man could not have been selected to represent the State; and important benefits would have accrued from his efforts had they been properly sustained. As it is, the great Golden State of California has been overshadowed, altogether, by an interior mining district, perched upon an isolated spur of the Rocky Mountains.

ORE CRUSHING.—Mr. S. W. Howland, at his ore-sampling establishment, No. 34 California street, still finds full employment for his patent ore crusher; while that machine, contrary to the experience with nearly or quite all other machines constructed on the principle of his invention, continues to work and wear in a most satisfactory and economical manner. His crusher consists of two conical-shaped cast iron shells, one above the other, with teeth on the inner sides, and also two toothed burs of similar shape and similarly situated, working within the shells, into which the rock is fed. It is compact and simple, occupying a space of not over six feet square, and is said to be able to crush from forty to sixty tons of limestone in twenty-four hours, and its full equivalent of work when operated on harder minerals or ores.

JASPER is procured to any required extent at St. Gervais, in Savoy, where there is a quarry of this mineral, with a surface of not less than 24,000 square yards. The quarry has been worked to the depth of 66 feet.

Fourteenth Annual State Fair.

(Continued from last week.)

**The Danforth Lamp.**—Gillig, Mott & Co. make an excellent exhibition of tin ware, stoves and rubber belting, accompanied with a fine show of the Danforth lamp, of all sizes and styles. This lamp, it will be recollected, is designed to burn without the use of a chimney—the draft supplied by that usual device is obtained by means of a fan-wheel, operated by clock-work, with such rapidity as to throw a steady and sufficient current of air upon the flame to secure a perfect combustion. A considerable saving is thereby effected by avoiding the breakage of chimneys, and it is also claimed that a steadier and clearer light is obtained. They were awarded a special premium and diploma for their lamps, honorable mention for their tin ware and belting, and a first premium diploma for the best family cooking stove, the "Good Samaritan."

**Benzine Light.**—Benzine is a light hydrocarbon, so volatile and inflammable that it is found necessary, in the process of distilling crude petroleum, to separate it from the ordinary illuminating oil—also there is great danger of explosion. It is employed chiefly in the place of turpentine in the mixture of paints, and latterly it has also been largely used for carbureting coal gas and for consumption in petroleum stoves. Its extreme volatility and cheapness renders it peculiarly well adapted for these purposes. When converted into gas it possesses a very high illuminating power—approaching to that of olefiant gas; for this reason many devices have been produced for employing it as an illuminating agent, but without much success until Mr. J. J. Hucks, of this city, conceived and constructed his "self-generating portable gas lamp," by which this cheap hydrocarbon is safely converted into gas at the instant of combustion. Its peculiarity is such as to render it especially serviceable when it is required to have a strong light in positions exposed to strong currents of air or to the wind; the latter is often the case in night work, in hydraulic mining, and the former almost always in tunneling and drifting. As an out-door lamp it cannot be excelled; it burns with a very white flame and great brilliancy in a very strong wind. It is the cheapest light which can be used—costing only from one to three or four cents per hour, according to the amount of light desired. Mr. Hucks has done a great public service, in thus opening up a new mode of utilizing a cheap and plentiful article of commercial product.

**California Pitch, etc.**—Messrs. Hucks & Lambert made a fine display of their famous axle-grease and of California pitch. They were awarded an especial premium for each of these exhibits.

**Rubber Cement and Paint.**—Eppes & Ellery, of 226 Jackson street, San Francisco, exhibited a patent india rubber cement and paint, composed of rubber and other gums dissolved in linseed oil, mixed with various coloring matters and ground in any color. It is considered a superior paint for roofs and brick buildings; also for ship and steam boat work. New cloth roofs, coated with this paint, are guaranteed for \$8 per hundred feet. No tar or asphaltum is used. It is especially recommended for repairing leaky roofs. It has secured large awards at different fairs in the Eastern States, where it was first introduced, and where it is well and favorably known. It is said to have been applied to more than ten thousand roofs.

**Staveless Barrels.**—Among the novelties at the exhibition was the "staveless barrel." This is a recent invention and attracted considerable attention. The wood for this barrel is first cut into veneers, the same as for ordinary cabinet veneering, being very flexible it is then wound spirally around a cylinder, so as to cover it. The outside is then covered with glue and another veneer put on so as to cover the first in such a manner that the grain of the wood crosses the first layer in a transverse direction. The barrel is thus built up to any desired thickness or strength. Some half a dozen veneers are generally used for an ordinary liquor cask. They are thus made in long sections, and when thoroughly dried or removed from the cylinder and saved up into proper length, for the size of the barrel desired. The heads are then made on a flat surface, cut into the desired size and shape by machinery and driven into the bodies, much like bungs into an ordinary cask, where they are readily secured. Such a barrel can undoubtedly be very rapidly and cheaply constructed; and if they can be so made that liquors will not moisten the glue, and thus destroy the cask, they may be introduced into very general use, and become of much value, especially for transporting petroleum and its more volatile products, for which

the ordinary barrel cannot be made tight enough. At all events we do not see why the staveless barrel may not come into large use for the transportation of grain and flour, on account of its less cost and greater durability than sacks. It is claimed that they can be made cheaper than an ordinary flour barrel. The entire machinery for their manufacture is quite inexpensive, costing only about \$12,000 in gold in New York. Joseph L. Lord, of this city, was the exhibitor, is the agent for the patentee, and is about organizing a company for their manufacture in San Francisco. Boxes, as well as barrels, can be made after this method.

A **Combination Wrench** was exhibited in model by Dewey & Co., the invention of Mr. John Mott, of Danville, in this State, the body of which consists of a wrench, hatchet, claw, nail-puller, hammer and vice. The handle is made hollow, and contains quite a number of small tools, such as gimblet, screw-driver, etc. The jaws are constructed parallel with the handle—a new feature in this tool. Honorable mention was made of the invention by the committee of awards.

The combination keyless lock, the invention of Mr. W. C. Barry, was also exhibited by the inventor, and attracted considerable attention from its novelty and apparent merit. It was awarded a diploma.

**Books.**—Messrs Roman & Co. made a very fine display of books, printed and published in California, one of which was printed from stereotype plates, the first which were ever prepared on the Pacific coast. This exhibition was especially important as showing that California is fast becoming independent of the East in the publishing business, so far as works of a local nature are concerned. A first premium diploma was awarded to Messrs. Roman & Co. for this display.

**Dewey & Co.**, proprietors of the MINING AND SCIENTIFIC PRESS, exhibited bound copies of their paper and copies of "Elements of Composition," written by Prof. Lyres, of this city, and printed by Dewey & Co. A special premium, diploma, was awarded for this exhibit.

J. L. Derby exhibited his improved school desks and seats, for which he was awarded a premium of \$3.

Matteson & Williams, of Stockton, were awarded one first and two special premiums for their exhibits of agricultural implements.

**California Files.**—J. Weichhart, of the California File and Tool Factory, were awarded a special premium for their exhibit of files of their manufacture.

The Pacific File Factory were awarded a first premium for files of their manufacture, a choice assortment of which they exhibited. These two establishments represent another new branch of California manufactures, and are fast placing us independent of Eastern manufacturers.

J. M. Allenwood, of Timhuctoo, Yuba county, exhibited a patented apparatus for holding and easily managing hydraulic pipes, when at work. The hose is so supported that the pipe may be easily directed to any point and the hose itself readily moved as occasion requires. The invention appears to be a very useful one for hydraulic miners.

**Seeds.**—Mr. D. L. Perkins made his usual creditable display of seeds—one hundred and twenty-five varieties—for which, as a whole, he was awarded a first premium of \$20, and various other premiums for individual excellence among the great number of articles exhibited by him.

The ladies, as usual, contributed largely, by the works of their hands and by their individual presence and smiles, to the usefulness and interest of the exhibition. The display of needle-work and machine-work was very large and good. Among the former we noticed a magnificent specimen of raised needle-work, by Miss M. A. Coates, of this city. It consisted of a couch cover, the center of which comprised a rich display of roses and rose buds, surrounded by a beautiful wreath, which formed the border of the cover. It was elegantly lined with green silk, and neatly quilted. It was fit for the couch of a queen. The committee showed their appreciation of the same by the award of a first premium, in the shape of a napkin ring.

**CALIFORNIA LEAD ORES.**—The ores of lead on this coast, besides being exceedingly abundant, are much richer in silver than the lead ores found in Europe. The silver yield of European lead ores seldom exceeds ten ounces to the ton of lead. The crude lead thus far obtained on this coast yields from 15 to 150 ounces of silver to the ton of lead.

A State University.

At a meeting of Trustees of the College of California, held on Wednesday evening last, it was unanimously agreed to tender, as a gift, to the Commissioners for locating the State Agricultural, Mining and Mechanical College, the beautiful site of ground six miles out of Oakland, which was some time since purchased by the College of California for their future and permanent location. The Trustees further passed a resolution agreeing to disincorporate, and pay over all their net assets to the State Institution whenever a classical branch is added to it, so as to complete its organization as a University. This donation, when completed, will amount in lands and money to at least \$100,000, and will furnish to the State Institution one of the most beautiful and eligible sites on the Pacific coast for its purposes. The Commissioners of the Mining and Agricultural College have already declared that that institution shall be located in Alameda county, and it now rests with them to determine whether this donation shall be accepted and fixed for its location.

The Trustees of the College of California have shown a noble spirit of generosity, in not only removing themselves from the paths of a State Institution, but in donating all their assets to its development and prosperity. It is hoped that this step will lead to the concentration of the educational influence of the entire State upon one institution. In no other way can we hope for many years to establish a Collegiate institution in California, worthy of the prominent position which we are soon to assume in the great family of States.

The State Commissioners meet again for some definite action next month; and we have no doubt but they will gladly accept the tender so nobly made by the College of California; and that the outgoing Governor, in his closing message, and the incoming Governor in his inaugural, will consider this a matter of sufficient importance to occupy an important place in their suggestions for the Legislation of the coming session.

**THE SCIENTIFIC EXPEDITION TO ALASKA,** was at Sitka on the 20th of August, waiting for an hour of good weather before starting for Onalaska in longitude 106 deg. The work has been retarded on account of continued rain, fog and wind, with little prospect for the better at this late season. At Fort Simpson the party waited six days and did not get an hour's sunshine. Some developments have been made and hopes are entertained of getting lines of soundings over the fishing banks south of the Fox Islands, but the want of coal deposits will limit the amount of work. When the expedition returns to Sitka, Mr. Davidson will make special local explorations. The Russians and Indians report that the country on the Copper Mine river is very rich in gold, copper and coal. There will probably be valuable diggings discovered there as soon as miners can go thither in large numbers, so as to overcome the Indians, who are very bad. Excellent reports are given of the harbor and surroundings of Archangel. The hay is never closed by ice.

Perry Davis' Vegetable Pain Killer.

This medicine has relieved more pain, and caused more real joy than any other one thing that can be named. It is a "balm for every wound." Our first physicians use it, and recommend its use; the apothecary finds it the first among the medicines called for, and the wholesale druggist considers it the leading article of his trade. All the dealers in medicine speak alike in its favor, and its reputation as a medicine of great merit and virtue is fully and permanently established, and it is the "Great Family Medicine of the Age."

Prices, 25 cents, 50 cents, and \$1 per bottle. Sold by All Druggists, Grocers and Medicine Dealer everywhere. 15-1511m

LEWIS FALKENAU. HENRY G. HANKS.

Pacific Chemical Works,

Laboratory, Sixteenth street, near Folsom. Office, 623 Montgomery street, San Francisco.

FALKENAU & HANKS, MANUFACTURING AND CONSULTING CHEMISTS.

Particular attention given to the analysis of Ores, Minerals, Metallurgical Products, Mineral Waters, Solls, Commercial Articles, etc. 14-1515

ROOT'S

Patent Force Blast Blower.

Adapted for Smelting, Foundry, Mining and Steamships.

Requires 50 per cent. less power than any Blower now in use. For further particulars, address KEEF, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5-151119p

Oakland College School.

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address,

I. H. BRAYTON, Principal. OAKLAND, California. 5-151492p.

LINSEED OIL.

**DRILLING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the bundled weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT

H. J. BOOTH & CO.

**VOLCANIC ERUPTIONS IN THE ATLANTIC OCEAN.**—The attention of the French Academy of Sciences has been called to the continued shocks of earthquakes and volcanic eruptions which have occurred for some time past on the coast of Portugal near Lisbon. The most violent action has been between two small islands, Tesira and Graciosa. On the 1st of June last a submarine volcano forced igneous matter above the surface of the ocean, and a tongue of land thus formed is now connected with the Continent.

WHERE THE GOLD AND SILVER GOES TO. The recent increase of the production of the precious metals, has given a wonderful impetus to the manufacture of jewelry in all parts of the world. The quantity of gold annually used by the French jewelers and goldsmiths is set down at *seventeen tons*, while the manufactured silver in the same country amounts to about ninety tons.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

THE SCIENTIFIC SCHOOL, at Worcester, Mass., the buildings for which are now in progress, is to be eminently practical, as well as scientific in character. This school, it will be recollected, was founded by the munificence of Mr. John Boynton, of Templeton, who gave \$100,000 towards it, about eighteen months since. The main structure will be three stories high, with a frontage of 150 feet, surmounted by a tower 85 feet high. Mr. Ichabod Washburne, of Worcester, is making preparations to erect and equip a large machine shop, to be connected with the school, where young mechanics can secure a practical, as well as a theoretical training.

A COÖPERATIVE iron rolling mill, which started at Alliance, Ohio, a year ago, with \$100,000 capital, has since doubled it. One hundred and fifty men are employed.

Luck lies in bed, and wishes the postman would bring him the news of a legacy. Labor turns out at six o'clock, and, with busy pen or ringing hammer, lays the foundation of a competence.

MODELINO CLAY moistened with glycerine is recommended for all the qualities of wax, except expensiveness and susceptibility to changes of temperature. The clay must be perfectly dried.

**Assayer and Chemist.**

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office.

M. S. WHITING. F. G. BERRY.  
**WHITING & BERRY,**

No. 609 Sacramento street, two doors above Montgomery, SAN FRANCISCO.

**TEA, WINE AND SPIRIT MERCHANTS,**

IMPORTERS AND WHOLESALE DEALERS IN FINE Brandy, Whiskies, Gins, Port, Sherry and Champagne Wines, Ale, Porter, Cider, Bitters, Cordials, Syrups, etc., for medicinal and family use, and supplies to families, apothecaries, physicians, city and country dealers, hotels, clubs, etc. In large or small quantities.

Observe firm name on each cork and fac similito of signature on label. Trade mark registered. This is the only exclusive Tea, Wine and Spirit Store on the Pacific coast. It is neither a saloon nor sample room (as no wines or spirits are allowed to be drunk on the premises), but a depot where selected Teas and Pure Wines and Spirits may be found, at wholesale and retail, for medicinal and family use. In this respect it is our aim to vie with Bininger & Co., of New York; Biglow & Davis, of London, and Cozzens & Co., of Washington, where every facility is offered to ladies, as well as to gentlemen, in making their own selections and purchases in quantities to suit. Our Treatise on Wines, Spirits and Teas may be had at our depot gratis, and will be mailed to consumers and dealers in the interior when requested.

**Piles! Piles! Piles!**

NOT PILES OF GOLD, NOR YET OF SILVER, SO much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

**WOOD'S SUB-POSITORY.**

Its preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. THE SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it if you are troubled with the Piles—you will not be deceived in it.

Sold wholesale and retail by J. H. REDINGTON & CO., Nos. 416 and 418 Front street; GEO. GRISWOLD, corner of Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Bush street, between Montgomery and Kearny. C. WOOD, Proprietor, No. 63 Tehama street, between First and Second.

**THE PACIFIC IRON WORKS,**

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unexcelled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c. &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greeno Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

**FIRST**

**Paint Manufactory**

IN CALIFORNIA.

EPES & E. H. R. ELLERY

Have the Patent Right for the Pacific Coast to manufacture, sell and use

Ellery's Patent India Rubber Cement & Paint.

It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

NEW CLOTH ROOFS put on, cupolas and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others; the roofs of all the horse and steam cars, docks or steamboats, etc., around New York—for eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just completed and painted the roofs of Dr. H. D. Cogswell, Tubbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis' building, 38 feet front, on Polson street, between Third and Fourth streets—only one coat. The work will speak for itself, how painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—remains sufficient elasticity to give and take with the heaving and swelling of the roof, and is not blown off by the wind. It is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—remains sufficient elasticity to give and take with the heaving and swelling of the roof, and is not blown off by the wind. It is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—remains sufficient elasticity to give and take with the heaving and swelling of the roof, and is not blown off by the wind.

EPES & E. H. R. ELLERY are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical water-wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:

- No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour. 850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour. 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The cylinder is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California, and Nevada. Diagram and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BRODIE & DODDLE, Express Building, 402 Montgomery street, San Francisco. 12v13tf

LEFFEL'S

American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

CALIFORNIA REFERENCERS.—E. Stockett, Folsom; O. Simmons, Oakland (Mill at Clear Lake); Morgan Coyne, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular to KNAPP & GRANT, Agents for California, 310 Washington street, San Francisco. 26v13-1yq

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to turn in any direction to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds, and is well known throughout the State. Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and for order. Water Tanks built to order. No. 28 Second St., and 103 and 110 Jessie St. 2v15qy San Francisco.

E. T. STEEN,

Commission Agent for the purchase and sale of

Engines, Boiler Castings,

AND ALL KINDS OF MACHINERY.

No. 537 Washington, and 632 Merchant st., San Francisco.

HAS FOR SALE

- One Engine, 6-Horse Power, - - - \$140
One Engine with Boiler, 7-Horse, - 600
One Engine, Link for Hoisting, 15-Horse, 800
Two Engines, Boilers, Port, 16-Horse, 1,200
One Engine, 40-Horse, - - - 1,200
One Iron Battery of 4 Stamps, - - - 500

Also, a great variety of

Boilers and Machinery,

CASTINGS OF ALL KINDS,

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency. 12v15qr

PICKERING'S ENGINE REGULATOR.

Warranted the Best in Existence.

Cheap and easy to attach to any Engine, old or new. Send for a Circular, to DAVID STODDART, 114 Beale street, San Francisco. 12v15-2am1q

Notice to Miners, Well-Borers and Water Companies.

MR PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing, etc. M. PRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND PLACER Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15 6m

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents.
Over \$20 and not exceeding \$50.....25 cents.
No fractions of cents to be introduced in an Order. United States Treasury Notes, or National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained. Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out: No. .... Amount .... Date, ...., 188 .....

MONEY ORDER.

Required for the sum of \$.... Payable at ....., State of ....., Payable to ....., Residing at ....., State of ....., Sent by ....., Residing at ....., State of .....

ENTERED IN REGISTER: ....., Postmaster.

The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given names of married women must be stated, and not those of their husbands. For example: Mrs. Mary Brown must not be described as Mrs. William Brown.

Names of parties and places, and the sums, to be written in the plainest possible manner.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

List of Money-Order Post Offices in the Pacific States and Territories, May 20, 1867.

Table listing money-order post offices in California, Nevada, and Oregon territories, including office names, counties, and locations.

"THE NATURAL WEALTH OF CALIFORNIA" is the title of a new work now in press by H. H. Bancroft & Co., of this city. The work will form a complete compendium of everything relating to the natural resources of the Golden State. The work has been written by H. C. Bennett and T. F. Cronise, both of whom have devoted much time, for several years past, in accumulating material for the work, and each of whom have enjoyed especial facilities for doing so. Mr. Cronise has been long and favorably known as a compiler of commercial statistics in this city, while Mr. Bennett is a journalist and scientific man of no mean attainments, and is thoroughly conversant with everything relating to the coast, having made a specialty of the collection of statistics and information, and having been engaged in the preparation of reports on the mineral resources of the coast ordered by the Government, and on other works of like nature.

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trust, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

A CHEMICAL THEORY OF CELL FORMATION. Dr. C. Montgomery has written a very remarkable paper, read before the Royal Society, December 20th, 1866, on the above subject. The whole paper has a very particular interest, and his facts are well worth verifying by all who have an opportunity of doing so.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 23, 1867. TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$350.

The Commercial Herald

MARKET REVIEW Will be issued early on EVERY STEAMER-DAY MORNING. (TRI-MONTHLY).

Office—Southwest corner Washington and Battery streets, Opposite Post Office and Custom House.

The HERALD will contain full and reliable commercial details, and elaborate articles on the monetary affairs of the Pacific Coast.

The Letter Sheet Market Review, Containing selections from the COMMERCIAL HERALD, printed on tissue paper, for transmission abroad, will be published simultaneously with that paper. Also, publication office of the

Weekly Stock Circular. Merchants can have their cards prominently inserted in the Letter Sheet MARKET REVIEW.

THE CENTRAL PARK OF THE PACIFIC.

Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, ZOOLOGICAL GARDENS.

ORANO INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays a GRAND CONCERT OF SACRED MUSIC, appropriate to the occasion.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.

These Gardens are accessible by the Howard and Market Street Cars. Entrances on Mission and Valencia streets, between Thirteenth and Fourteenth. OPEN EVERY DAY.

NELSON & DOBLE, AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, San Francisco.

Golden City Chemical Works. LABORATORY, Corner of Seventh and Townsend Streets. OFFICE, Corner of Montgomery and Bush Streets.

WM. H. KEITH & CO'S Proprietary Preparations. Florentino Tooth Wash; Saponaceous Tooth Powder; Rosemary and Castor Oil; Wine of Peppino; Oueolein; Devine's Pitch Lozenges; Verbena Water; Bay Rum; Cologne Water; Aurantine;

THE GREAT LIGHT. THE DANFORD Atmospheric Lamp. This Lamp burns coal oil, requires no chimney, gives a pure white and steady flame, uses thirty per cent less oil than any other Lamp in proportion to the amount of light afforded, and is absolutely indispensable in every house where gas is not used.

Pratt's Abolition Oil. FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Head-ache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lumbic Back, and all aches and pains. It is the poor man's friend, and the best family physician.

GOVERNMENT HOUSE, Corner of Sansome and Washington sts. SAN FRANCISCO, CAL. THE STREET CARS PASS THIS HOUSE IN every direction, every ten minutes.

WESTERN HOTEL, Nos. 43 and 45 K street, between Second and Third streets, SACRAMENTO. Board, per week \$4 Meals, 25 Cents. 12v16gr N. D. THAYER, Proprietor.

PACIFIC Insurance Company, SAN FRANCISCO, CAL., Office, No. 122 California Street. CASH ASSETS, JULY 1, 1867, \$1,238,054 91.

HAYWARD & COLEMAN, IMPORTERS AND REFINERS. Illuminating, Lubricating, and PAINT OILS! CONSISTING OF KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATSFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

BLAKE'S PATENT QUARTZ CRUSHER. CAUTION! The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissuance of the Patent, bearing date January 9th, 1866.

California Steam Navigation COMPANY. Steamship CAPITAL.....CAPT. E. A. POOLE CHRYSOPOLIS.....CAPT. A. FOSTER. " YOSEMITE..... " " " CORNELIA.....CAPT. W. BROMLEY " JULIA.....CAPT. E. CONKLEIN.

LOWER CALIFORNIA Exploring and Prospecting COMPANY. This Company have procured the services of parties that are well acquainted with the country. This Company will also prospect for Mineral Lands, Water Privileges, Town Sites and Harbors, etc.

It is a Fact, That BOWMAN'S AMERICAN WASHING COMPOUND is the best article for Washing and Cleaning yet discovered. It is acknowledged to be a saving both in money and labor. As the compound softens the dirt, the clothes require not more than one-half the rubbing necessary in washing by the old method; besides all who give a trial acknowledge that their clothes are whiter in washing with this Compound than they were ever known to be by using any other preparation.

WARRANTED NOT TO INJURE THE CLOTHES. For sale by all Grocers. LYNCH & PARSONS, Agents, 14v13-3m 225 Jackson street, near Battery.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions...

PATENTS RECENTLY ISSUED.

68,359.—AMALGAMATOR.—Henry A. Gaston, Nevada City, Cal.: I claim, 1st, The dies, E, in the bottom of the pan...

2d, The mullers, A, when constructed of a spiral form whereby they are made to spread or grind the pulp when rotated in one direction...

68,406.—FURNACE FOR ROASTING ORES.—John Agrell and John Klepzig, San Francisco, Cal.:

We claim a furnace for roasting ores, etc., provided with a rotating hearth with the fire acting on its upper surface, as described.

We also claim providing a rotary hearth with a door to discharge the ores or contents acted on by the fire.

We also claim mounting the rotating hearth of a reverberatory furnace and rollers, substantially as described.

We also claim providing the rotating hearth with partitions to hold the brick lining in place.

In combination with the rotating hearth we claim the stationary stirrers.

We also claim making the shaft which holds the stirrers hollow, for the purpose of supplying steam to the ores roasted on the hearth.

This invention consists of a reverberatory furnace, with a rotary hearth, the object being to provide an improved furnace for roasting ores, by the use of which much labor which is now necessary, may be dispensed with...

68,422.—MODE OF PRESERVING COFFEE.—August Eikrenkötter and Frank Silver, Searsville, Cal.:

We claim the process herein described for preserving coffee.

We also claim the product as herein described, as a new article of manufacture.

The nature of this invention is to preserve coffee in its natural strength and flavor, without deterioration in any climate, whatever, and without regard to the length of time it may be kept before using it.

68,430.—CAR COUPLING.—George Hardy Henfield, San Francisco, Cal.:

I claim the cam, F, operated by the lever, M, in combination with the jaws, D, closed as herein described.

I also claim the sides, A, jaws, D, spring, E, cams, D and F, and levers, E and N, together with the bar, I, the whole operating as a coupling, substantially as herein described.

The object of this invention is to provide an improved "shackle" or "car coupling," which is design to obviate many of the difficulties attendant upon the use of those of the present mode of construction.

serve to close these jaws, which are then secured by a clamp or clasp on the outside. The attaching bar from the other car is released, when desired, by means of levers, which open the jaws, the whole being easily operated, and with perfect safety.

68,475.—VINE TRELLIS.—Levi H. Whitney, Vallejo, Cal.:

I claim, 1st, The combination of the bearing wires, B, lateral wires, C, and vertical wires, D, for the purpose of forming a trellis, as described.

2d, The thimble loop, b, shown in Fig. 3, substantially as and for the purpose described.

3d, The perforated tag, G, shown in Fig. 6, in combination with the trellis wires, B, substantially as shown and described.

4th, The vertical wires, D, D, equally spaced and spread apart at their upper ends, and grouped together at their lower ends so as to be secured at a single stake at the hill, substantially as shown and described.

68,617.—IRONING MACHINE.—Patrick J. Flanedy, San Francisco, Cal.:

I claim, in combination with the lever frame, I, the cross-head, K, the ways, J, J, straps, K', K2, and frame, L, substantially as and for the purpose described.

I also claim the lever, M, in combination with the slotted arm, N, shaft, O, pedal, d, and spring, c, substantially as and for the purposes set forth.

This improvement consists in a combination of devices, by means of which the operator is able to traverse a heated polishing iron from and towards him, upon a polishing board or wheel. The modus operandi of working the machine is as follows: 1st, The wheel is to be covered with flannel or other suitable material; 2d, The piece to be polished must be placed on the wheel, which is then set in motion by an eccentric cam, and other devices, giving it a backward and a forward motion, by means of which the linen is drawn under the heated polishing iron.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2V15

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, prevents explosions, and protects life and property.

MINING COMPANIES

Can get their Printing done cheaper and better by TRUESDELL, DEWEY & CO., Than at any printing establishment in the city.

COUNTY OFFICERS

Can get their Blank Books and Blanks cheaper of TRUESDELL, DEWEY & CO., Than of any other printing house in the city.

MERCHANTS

When you want Printing done cheap, send to TRUESDELL, DEWEY & CO., Who do all kinds of Printing at the lowest rates.

FOUNDRIES

Will save money by having their printing done by TRUESDELL, DEWEY & CO., Who have put prices down to the lowest rates.

EVERYBODY

Who wishes to save money and get good work, see TRUESDELL, DEWEY & CO., Who are always ready to receive and fill orders.

Foundry for Sale.

A One-half Interest in the UNION IRON WORKS, SACRAMENTO, Owned by William R. Williams, is offered for sale on the most favorable terms.

A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal. 26V13T9-16p

Dr. Hufeland's Swiss Stomach Bitters.

THE WORLD RENOWNED REPUTATION, TOGETHER with the extensive and increasing demand for Dr. Hufeland's Swiss Stomach Bitters, will at once recommend them to the favorable notice of all connoisseurs and owners of good and healthful tonic and invigorator. As a purifier of the blood, acting surely, yet gently, on the secretions of the liver and kidneys, they are unsurpassed, and a most agreeable drink.

For sale at all wholesale and retail stores on the Pacific Coast, and at the depot of TAYLOR & BENDEL, 413 and 415 Clay street, between Sansome and Battery, San Francisco. 20V14-6m

NOTICE TO CREDITORS.—IN THE PROBATE Court of the City and County of San Francisco, State of California. Estate of HENRY GAMMEL, deceased. Notice is hereby given by the undersigned, Administrator of the above named estate, to the creditors of, and all persons having claims against said deceased, to exhibit the same, with the necessary vouchers, within ten months from the first publication of this notice, to the undersigned, at his office, No. 23 Court Block, 656 Clay street, San Francisco. Dated October 3d, 1867. ANDREW D. SMITH, Administrator of the Estate of Henry Gammel, deceased. 14V15-1W

Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866: I. Applicants' Declaratory Statement. II. Diagram, Description of Diagram and Boundaries, and Notice. III. Register's Order for Publication—with Notice. IV. Deposition that Notice has been Posted. V. Application for Survey Etc. PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid. Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco. Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

## Hooker's Patent Direct-Acting Steam Pump.

In this issue of the Press we present an excellent illustration of Hooker's Direct-Acting Steam Pump. Among the advantages claimed for this pump are the following: Its extreme simplicity, being composed of fewer pieces than any steam pump yet known, the working parts consisting simply of the steam and pump pistons, a plain cylindrical balance valve, and the pump valves, operating in their respective cylinders without any journals or other movable or intermediate machinery whatever. 2d, The steam valve is a plain cylinder, perfectly balanced in its movements, and is operated by the steam after it has completed its work

and any other information, address Wm. D. Hooker, inventor and patentee, Union Iron Works, San Francisco.

CALIFORNIA WOODS AT THE EAST.—Mr. J. D. Boyd, the well known artificer in California woods, has just shipped for New York a number of unsawed logs and manufactured boards of California laurel, consigned to Wells, Fargo & Co., for Mr. Fargo, at Buffalo. There were sent, also, a quantity of veneers, and samples of wainscotting and moldings of the same wood, finished and polished according to Mr. Boyd's method. There is, besides, an invoice of 10,000 feet of redwood boards for the same destination. Mr. Fargo designs using these woods in finishing the interior of some

## Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

179—Mr. A. S. Hallidis sends us the horns of a mountain sheep, a native of British Columbia. The animal from which these horns were taken was caught by an Indian, on a mountain near Fraser river. The horns are about ten inches long, very fine and sharp at the tips. They are evidently well calculated for fighting, and quite unlike the horns of the Rocky Mountain sheep.

We have received from our agent, A. B. Butler, now traveling in Nevada and Sierra counties, a box of very fine specimens, as follows:

180—Bircbville Co., Bircbville, Nevada county, shows gold distributed upon one of its faces in a very peculiar striated manner.

181—From same mine as above, also shows free gold, but not striated as in the one previously noticed. This ledge is owned by Thompson, Hyde & Co., who have just erected a 5-stamp mill.

182—Commercial ledges, Valentine Co. This ledge is very well opened for working, and this company has just started a 10-stamp mill, built by Booth & Co., of this city. This rock has a very fine appearance, and we trust, will fully realize the anticipations of its enterprising proprietors.

183—From the Black & Young ledge. This rock presents very much the appearance of No. 182. A pretty good evidence of the value of the ledge may be inferred from the fact that a portion of it has recently been sold for \$20,000. The company have a fine mill.

184—From the Banberry, or Rocky Glen ledge; Stacy & Co., proprietors. Somewhat honeycomb in character, showing considerable free gold. This is considered one of the finest ledges in the district, considering its size—a six-foot vein.

185—Is from the same ledge as above. Rock firmer—quite hard and white; shows free gold and a slight sprinkling of sulphurets.

186—From the Norfolk claim, Passamore; Booth & Co., proprietors. This specimen is very highly charged with sulphurets, which have every indication of being rich in gold.

187—From the same ledge, is a sample of the white rock, free from sulphurets.

188—From the liberty ledge, Dean, Stevens & Co.; a small specimen, but rich in free gold. This is said to be a very large vein, and quite well developed; a good grade of ore on the average, and paying satisfactorily.

189—Is a specimen from the same ledge, showing galena.

190—Is from a ledge owned by D. W. Snapp; shows free gold.

We have several other specimens from the same source, which will be noticed next week.

CHINA TEA CULTURE seems to be fast approaching a success in Georgia.

THE OREGON CENTRAL RAILROAD.—The prospects of this road are said to be encouraging. It is reported that the Secretary of the Interior has officially recognized the company's right to the Government subsidy of 12,000 acres of land to each mile of railroad built, which it is estimated will be worth \$1.75 per acre; in addition to this the State of Oregon guarantees the interest on the company's bonds at the rate of \$10,000 per mile for 100 miles. This will give the company about \$30,000 per mile for the first 100 miles, with which it is thought they will be able to build and equip the road for that distance. The farmers along the line of the road are taking stock quite liberally. The road, if built, will pass through one of the richest agricultural sections in the Union, the most of which is now comparatively worthless, on account of its distance from a market. It is to be hoped that this much needed work will be speedily put through.

FLOUR MILL FOR SAN BERNARDINO.—In addition to the machinery elsewhere noticed as in course of construction, at the Pacific Foundry, for the Fremont estate, we learned that these works have also on hand all the iron work for the machinery of a flour mill, to be erected in San Bernardino county, by Messrs. Pollard & Childs; as well as a large amount of miscellaneous work, jobbing, etc. Persons desirous of witnessing the mode of construction of the new quartz machinery which is said to be doing such extraordinary work in Mariposa county, would do well to take a look at that now in process of construction at the Pacific Foundry.

THE UNION WAR CHART.—An invoice of this useful publication was received by the last steamer, and is now being delivered by Mr. A. J. Doolittle, agent for this coast. We have already noticed this chart, and we doubt not it will find a large and ready sale. It is very convenient for reference, and is put up in book form or mounted on rollers.

MINING IN COLORADO.—Five veins of argentiferous galena are now being worked in Colorado. Considerable quantities of argentiferous zinc are found in the "Terrific" lode. Auriferous ores (pyritous or concentrated sulphurets, we presume,) averaging not less than \$30 per ton, are in demand at the reduction works of the Briggs and Gannell companies.

HOOKER'S PATENT DIRECT-ACTING STEAM PUMP.

and is ready to be exhausted from the engine—thus economizing the use of the steam to a great extent. 3d, The valves, both in the steam and water cylinders, can be removed and replaced in less than five minutes. 4th, It is claimed that its speed and capacity far exceeds any steam pump yet known; it will also operate as slow as one stroke per minute, and make its strokes with unerring accuracy.

It is peculiarly adapted to raising and forcing water from mines and shafts, steam being carried to the machine in protected pipes. As a steam fire engine, it is unsurpassed. It is claimed that it will surpass the Gifford Injector, as a boiler feeder, both as to capacity, cost, greater range and certainty of movement.

It was first exhibited at the State Agricultural Fair, held in Sacramento, September, 1867, and was awarded the first premium over all competitors, for its simplicity and rapid motions, and recommended for steam fire engines and general purposes. Several sizes of steam pumps and boiler feeders are in process of construction. The price of the six-inch diameter steam cylinder, with three-inch diameter water cylinder, and eight-inch stroke, is \$250; capacity, 5,875 gallons per hour; cost of other sizes, smaller and larger, in proportion. For circulars

and buildings he is erecting, he having heard them so highly extolled as adapted for such purposes. It is intended to have the furniture made from the same logs as the wainscotting is to be taken from, to produce uniformity of appearance. Our Eastern friends are beginning to appreciate the beauty of California woods.

HENDY'S CONCENTRATOR.—We understand that the North Star Company are putting four of Hendy's concentrators into their mill at Grass Valley; also that the Norridge-wock Company, of the same place, have decided to adopt them. Parties in Grass Valley, or those visiting that place, would do well to examine these concentrating machines, and carefully note their manner of operation. By reference to Mr. Hendy's advertisement on the ninth page of the present issue, a full description of this machine will be seen, also an important letter from Mr. S. W. Lee, Superintendent of the Empire Co's mill, of Grass Valley, addressed to Mr. Hendy, and expressive of the writer's satisfaction at the work of this concentrator.

CONCRETE.—They are making concrete bricks in Colorado ten inches long, five inches wide and four inches thick, by a machine which turns out 800 such blocks per day. They are building houses with these blocks.

## Communications.

In THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Entered according to Act of Congress in the year 1866, by F. A. Herring, in the Clerk's Office of the District Court of the District of California.)

## Formation, Distribution and Age of Igneous Rocks.

Continued from Page 210.

If there was a period during which metalliferous quartz was erupted in such quantities as the vast deposits of old red sandstone would seem to indicate, the origin and formation of these deposits of hematite ore may be readily understood. Large bodies of erupted quartz carrying sulphuret of iron coming in contact, while yet hot, with water, would greatly facilitate disintegration and decomposition. The waters of the eruptive era, metalliferous quartz or old sandstone period, must have been strongly impregnated with sulphate of iron, which was decomposed by the sulphuric acid combining with lime, the iron being precipitated as a peroxide. Peroxide of iron seems only to have been deposited as the coloring matter during the old red sandstone era. It was during this era that feldspathic granite was intruded in a plastic state along anticlinal lines forming cones and belts, frequently of great extent, and with the termination of the old red sandstone period, the intrusive granitic era may be said to have passed away.

The eruptive era of metal bearing rock ended with the beginning of the carboniferous era or fifth period, and henceforth only such rock as contained little or no metal is brought to the surface in a fluid state by volcanic action. The igneous rocks, intrusive and eruptive, of the carboniferous era, are all of the trap family. Trachytic trap is the eruptive rock, and is found interstratified, unchanged, with the formations of the carboniferous system. Of all igneous rocks, those of the trachytic type are the least destructible. They resist all ordinary chemical action, and owing to their refractory nature, they are the earliest of the igneous rocks which are found interstratified with the aqueous formation. The intrusive rocks are chiefly greenstone, serpentine, soapstone and other magnesian rocks, dykes of which pass indiscriminately through the old red sandstone, magnesian limestone, and coal measures, and are only found along some anticlinal axes of the carboniferous era. At the beginning of the carboniferous era the earth seems to have undergone a great change in its geological conditions. The erupted rock has now, owing to its power of resisting chemical action, very little to do in giving character to the stratified deposits of this system. The carboniferous era began with the deposition of an immense body of limestone which was held in solution, and had been accumulating in the waters. All of the carbon that afterwards became fixed, existed in the atmosphere as carbonic acid gas, and of course the water was strongly impregnated with the gas, thus rendering it capable of holding a large quantity of lime in solution. During the old red sandstone period, the capacity of the water for holding limestone in solution, was greatly increased by the carbonate of lime being attacked by the sulphuric acid contained in the sulphate of iron, which was so abundant, thus liberating a still larger proportion of carbonic acid. When the rank vegetation of the coal measures came into existence, this excess of carbonic acid in the water was appropriated, thus facilitating the deposition of the limestone.

As the disintegrated granite furnishes the feldspar, quartz and mica of the gneiss and mica schist system, and from them again, with the erupted feldspathic granite and magnesian rocks, were obtained the materials for the clay slate and silurian rocks, so from all these, together with the old red sandstone, were derived the material for the carboniferous system. Two new rock substances made their appearance among the strata of this system—namely, coal and ironstone. The iron of the old red sandstone

was disseminated through the mass as mere coloring matter—in the carboniferous formation it is principally collected in layers or in nodules. Bodies of sulphuret of iron, which were erupted during the old red sandstone period, and escaped decomposition by being submerged, were now upheaved together with contiguous deposits of limestone. The sulphuret of iron ore being exposed to the atmosphere, would decompose, and the soluble sulphate would be carried to the depressions in the limestone. The sulphuric acid, combined with the iron, would attack the limestone, liberating the carbonic acid, and the body of the limestone might pass away in solution to a new locality. Thus the reservoir in the limestone might go on increasing in breadth and depth, and the deposit of hematite ore would be limited in extent only by the supply of sulphuret of iron. On trying an experiment with a piece of marble and coppers, each the size of a filbert, the coppers being dissolved in water, I found the marble after being immersed a few hours, became so soft and friable as to be easily crumbled with the fingers, and the bottom of the glass was covered with a brown curly deposit. The formation of bog ore in our own era, occurs in the vicinity of mountains containing decomposing sulphuret of iron.

The intrusive era of metal bearing rock began with the sixth, or new red sandstone period. That some metallic veins are of comparatively recent origin, no one can doubt who is familiar with their general appearance. Some veins and cones of metalliferous quartz, appear to have been intruded so recently, that the geological features of the adjacent country must have been quite the same as they appear to-day. One vein of auriferous quartz which is five feet wide at the surface, gradually closes out to five inches in width in twelve feet, at which depth the country rock is schistose and solid, thus showing that the soil was nearly or quite its present depth at the time the vein was intruded in a plastic state. Sometimes one side of a vein of intruded quartz is striated, showing it to have been forced up in a plastic state. Profs. Rowlandson, Whitney, Blake and others contend that auriferous veins are found enclosed within walls of rock which contained molusca of the jurassic age. Prof. Rowlandson says there is a vein of cinnabar in the Coast Range that must have been formed as recently as the eocene period.

That there are two periods during which metalliferous quartz was brought to the surface by volcanic action, is a general truth which applies alike to all igneous rock. The original surface igneous rock, before water rested upon the earth, we know, was granite, because the earliest deposited aqueous rock is altered granite or gneiss. As the original granite was everywhere over the earth's surface, exposed to disintegrating agencies, the gneiss formation must originally have covered the whole earth with a stratum of varied thickness. Yet we not only find this deposit of altered granite, intersected by dykes of granite, but veins and cones of granite along anticlinal lines, intersect and overlie the two following geological ages up to and to the old red sandstone period. The clay slate system was deposited during the eruptive era of feldspathic granite, and veins of feldspathic granite intersect all the formations up to the carboniferous system. Veins of granite, from a few feet to many yards in width, are found intersecting the clay slates flanking the Sierra Nevada. Veins of porphyry and greenstone, and other magnesian rocks, also intersect deposits of altered porphyry, hornblende slates and other stratified magnesian deposits, and veins of metalliferous quartz intersect all the formations up to, and including the tertiary, and possibly later. I have seen auriferous quartz veins in such a position as to show most conclusively, to my mind at least, that they were very much more recently formed than the more ancient gold bearing gravel deposits. There is a cone of quartz belonging to a traceable vein situated near the junction of Slate creek and Yuba river, which, from its position and general appearance, seems to have been intruded in a plastic state at a period so recent that the geological features in its vicinity have undergone very little if any change since its formation. The channel of the Yuba, which at this point must be near 2,000 feet in depth, cuts an ancient auriferous gravel deposit, or old river bed, which caps the most elevated ridge in the immediate vicinity. This cone of quartz is situated at least 1,500 feet down the steep bank of the cañon and below the gravel deposit, and its peculiar form and the striations upon the quartz of other similarly situated veins, shows the vein matter to have been intruded in a nearly congealed state.

There is another vein of quartz situated on the bank of the north Honcut in Butte

county, which is only a few rods from the creek, and perhaps twenty feet above its bed. The Honcut cuts the blue cement deposit near Bangor, and the head of the stream is near 200 feet below it. The croppings of this vein appear to have displaced the loose surface soil, and at a greater depth, as the disintegrated schistose rock becomes solid, the vein decreased in width, then showing the soil to have been quite its present depth at the time the quartz was intruded. In another locality there is a flattened body of quartz, nearly circular in form, resting upon the surface of the red soil, which is some twelve feet in depth, and within a few yards of a ravine situated near the summit of an elevated ridge flanking the Sierra Nevada. The surface of this body of quartz dips at nearly the same angle as the bank of the ravine, and has every indication of having been intruded in a nearly congealed condition, at a period so recent as to show conclusively that even many of the little ravines upon the hillside remain unchanged. But for those who are acquainted with the appearance of quartz veins in the Sierra Nevada, there is no occasion to multiply instances of this character, which show that some auriferous veins are of comparatively recent origin.

(To be Continued.)

[From our Traveling Correspondent.]  
Mining in Nevada County.

**LITTLE YORK.**—There are two gravel mills in this place, owned by Messrs. Buckman & Curran. Their lead promises well, and doubtless when further developed, will afford a fair dividend to its proprietors. Mr. Gardner is running a hydraulic claim, which is said to pay very well. With the exception of these enterprises the town is rather dull; its citizens appear to be mostly engaged in quartz enterprises at Meadow Lake, the famous U. S. Grant claim, and other lodes having been discovered and located by citizens of this place.

**YOU BE** is running about fifty stamps, crushing blue gravel, and making times comparatively lively. The writer visited five mills, all in active operation, and apparently doing well. Messrs. Neece & West are working the lower end of the lead, while three mills, owned by Mallory, Brown and Hydellif, respectively, are working the upper end of the same channel. Mr. E. Williams also has a fine little mill, between this place and Red Dog, which is working beautifully and said to be paying very well. At Hunt's Hill, two miles above Red Dog, there are also two mills—Gouge Eye Co. and the Easton Co.—both at work, taking out and crushing some of the best looking gravel seen in the county, specimens of which are often found completely spattered with the precious metal.

**NEVADA CITY.**—The Manzanita mine, owned by Marcellus & Co. is quite extensive. It is a hill claim, and pays from "grass roots" to "bed-rock." It is worked by hydraulic, ground sluice and stamps. The latter consists of a 15-stamp mill, driven by hydraulic hurdy-gurdy power, crushing about eighty tons per twenty-four hours, at an expense not to exceed \$1 per ton, including the entire cost of mining and milling. The ore crushed consists of quartz gravel and boulders, taken from the lower strata of the mine. Many of these boulders are rich, showing the free metal and considerable sulphurets. The yield of the mine and mill appears perfectly satisfactory to the owners, as evidence of which they are not for sale.

**Star Spangled Banner Ledge, Tisdale & Co.**, are erecting new machinery to enlarge their crushing facilities. They have a first class mine, affording good \$30 rock, with prospects of realizing more as soon as they avail themselves of all the improvements in working sulphurets.

**The Wigham, Merritt & Co.**, San Francisco, Nevada Co's mine, and the Cornish mines are all evidently doing well and prospering. The California, Pattee & Co., also the Providence, Dingley & Co., are apparently good mines, with good mills attached. The California mill, especially, is a model arrangement of convenience and neatness, worthy the examination of any one contemplating the construction of crushing and hoisting works. Both these mines will doubtless resume operations in due time.

**GRASS VALLEY.**—This place, as every one knows, affords some of the best paying mines of the State. The Eureka, Watt Bros, part owners and exclusive managers, stands first, and is without doubt, as far as known, the "Ne plus Ultra" of a California

quartz mine. This mine runs a 20-stamp mill, and could run as much more if desired, crushing two tons per stamp, the rock averaging \$45 to \$50 per ton, and taken from a vein not less than four feet average width. The Watts are considered the most experienced and best practical quartz miners in the State; they know how to run the "machine."

**The North Star**, a San Francisco Co., W. H. Rodda, Superintendent, affords remarkably rich ore, and is considered a first class mine. It also cost a first class price, \$45,000. It employs a vast number of men and does a glittering business.

**The Ophir** is rattling away with its beautiful 30-stamp mill, apparently doing a fine business, and crushing good looking ore.

**The Wisconsin** is an extraordinary rich vein of quartz, varying from twelve to eighteen inches in width, showing large amounts of free gold throughout the entire "breast" of 100 feet on the line of the ledge. The ore is judged to be good \$90 rock. At present, the company only have machinery sufficient to work the mine; but will doubtless erect a 10-stamp battery in time for another season.

**The Lucky**, G. V. Barber & Co., have a fine ledge of from fifteen to twenty-four inches in width, supplying a 15-stamp mill (battery and blanket process), and crushing twenty-five tons per day, with an average yield of \$15 per ton.

**The Cambridge**, James Powning, Superintendent, is preparing to rush matters very soon. Mr. Powning expresses confidence that he has "got it," and will soon be able to "show it." There are numerous other mines that are being prospected with considerable vigor, some of which are presenting very favorable developments, showing clearly that Grass Valley and vicinity has not uncovered one-half of the rich mineral veins with which it abounds.

**Hydraulic Mining**, commencing at French Corral and extending in an almost continuous line through Birchville, Sweetland, Sevastopol to North San Juan, is here carried on with more thoroughness and enterprise than in any other portion of the State. There are quite a number of rich claims that have paid the present proprietors amply in piping off the top; but the owners are not, or do not feel themselves able to construct an outlet sufficiently low to work the bottom, the richest portion of their ground. Of this character of claims, many of them could be purchased in a body together, at very reasonable rates, affording in the judgment of many experienced miners the very best chances for investment of capital. There are some few of the present owners who have joined their means together, for the purpose of running a tunnel.—making an outlet sufficiently low to work their whole ground jointly. This range of ground is certainly well worthy of investigation by capitalists, having a view to extensive and highly remunerative investment.

Among the many paying claims that are now being worked, the writer will only mention two—the Buckeye and the American. The former, Gen. O. Evans, principal owner, recently made a clean up of \$22,000 from twenty-eight days run. The latter, owned by Brown & Co., have two mills on their claim, one crushing gravel—the other grinding and amalgamating sand from the "under current." This is called the most extensive, as well as the best paying mine in the whole range. From Columbia Hill via Humbug to Moore's Flat, the same complaint exists, viz., the want of capital to cut an outlet. Millions of money lie buried in these channels, which cannot be reached by individuals, or in any other way except by heavy organized companies, who are willing to expend from \$50 to \$150,000 in opening up a tract of mining ground that will unquestionably reward the adventurers with dividends heretofore unparalleled in the history of placer mining. By the way, it is reported that a New York company is about making an extensive purchase near Columbia Hill. Should this be effected, something interesting may be looked for, as the writer knows the parties purchasing—and whatever they undertake, is based upon sound practical judgment and experience. At Humbug, a San Francisco French Company have made a purchase, also made a very fair beginning; yet it is feared by many of the knowing ones, that they are not low enough in their main outlet to work all of their ground. Mr. Chas. Beaver is superintending, and doubtless knows what he is about.

At Moore's Flat, several extensive hydraulic claims are now being worked very successfully. The principal ones are Pinte and Eagle, Illinois, Pioneer, Paradise, Buckeye, Blue Banks and XIX. Mr. W. D. Long will favor the Press with statistics and items of this place from time to time. More next week. B.

## Mechanical.

## Machine Tools.

It is both interesting and instructive to mark the foot-prints of progress as they have been impressed, from time to time, in the creation of labor-saving machinery. In no department of human ingenuity have more happy or more important results followed than in that which has for its object the origination of mechanical appliances and tools for the accomplishment of the many difficult, and often very irregular kinds of work, which are called for in the machine shops. It is really wonderful to look back and note the gradual progress that has been made in machine tools. The practical details of this progress are worthy of the most careful consideration; this more so because they are not often set forth in such a manner as to render the details ordinarily available for instruction and further progress.

In machine tools, as in other kinds of machinery, the chief value of an invention depends upon the economy with which the desired work is accomplished, or in this amount of work which it will turn off, with the least requirement of power and attendance, and the least derangement and wear and tear of itself. It is not enough that the machine should simply do its work; but that in the completeness of its detail it must do it in the best and cheapest manner.

Many complicated pieces of mechanism are brought forward which, although they accomplish their work satisfactorily, are nevertheless so intricate in detail as to forbid their general introduction into use, on account of the skill required to operate them and keep them in order. It often happens that the first inventor of a machine loses the chief benefit of his invention from the above cause, which is remedied by a subsequent simplifying improvement, without which the original is of but little value. Simplicity and practicability are the great secrets of success in the inventions art.

The wonderful exactness, as well as the great beauty of finish seen in machinists' work of the present day, is almost if not entirely due to the employment of machine tools in the accomplishment of that work. Many of our readers can recall to mind the time when the "chipper" and "filer" made slow and expensive progress, at processes which are now done with great celerity and the utmost exactness by the planing, the shaping and the slotting machines. Time was when the "lathe-man" indifferently performed with hand tools what is now so accurately and more expeditiously accomplished with the "slide lathe." The ruder workmanship of former days was far more expensive than the costly, more perfect and elaborate work of to-day. True, there might have been more mechanical skill then employed than now; inasmuch as it required a much better mechanic to fit up a piece of work by chipping and filing, than it does by the mechanical operation of the various machine tools now employed in such work.

It is not, perhaps, claiming too much for machine tools to say, that without their aid the great advance now witnessed in the more intricate mechanisms of the present day could never have been accomplished. The sewing machine, the repeating pistols and rifles, the improved marine, locomotive and stationary engines, which we now have, could hardly have been turned out by the chippers and filers of forty and fifty years ago. Such machines may be said to be exclusively due to the recent introduction of machine tools, which have so economized and perfected labor as to reduce it to absolute mathematical exactness. What machinist, of either the past or the present, would have undertaken the construction of such cylinders as are now employed on our larger steamships, if it had been a condition of such construction that their interior sur-

face should have been performed by chipping and filing, as was the case in the construction of the cylinders of the Boulton and Watt engines, when those machines first made their appearance in England? Without the aid of machine tools a steam cylinder of 105 inches diameter and 12-foot stroke, would never have been called for; the modern locomotive would never have been thought of; the sewing machine would never have made its appearance in our dwellings, or at best its tedious and expensive construction would have confined it to the hands of a favored few; while the old musket and rifle and double-barreled shooters would have still continued our most efficient weapons of defence or attack.

## Evaporative Power of Steel over Iron Boilers.

A late number of the *Engineer* gives a detailed account of some carefully conducted experiments, made in November last, in the workshops of Messrs Fink & Elber, at Hagen, in Prussia, on the comparative evaporative power of steel and iron boilers. The experiments were made under the direction of M. G. Stucknholz.

For the purpose of conducting the experiments, two ordinary cylindrical boilers were constructed, the one of 0.5-inch iron, and the other of 0.33-inch cast steel, and set in separate furnaces; the area of the fire bars of each was twelve square feet. Both boilers were new, and each was filled with 712 cubic feet of water, at 35° centigrade. The fires were kindled and the temperature of the water raised to 100° C., with the man holes closed. The fires were then drawn and the cinders and ashes removed. The man-holes were then opened to allow a free escape of steam, while the fuel supplied was carefully weighed. The fires were so arranged that there should be an equal speed of escaping steam from each boiler. The escape was carefully measured by an anemometer, which showed 220° of List's scale. The temperatures of the escaping steam of each boiler, (measured six feet from the back of each,) ranged from 340° to 380°, C.

After 3,150 pounds of coal had been consumed in each boiler, the fires were drawn, the man-holes closed, and the following day the water remaining in the boilers was measured at a temperature of 35°, by means of a water meter. The iron boiler contained 337 cubic feet, while the steel boiler contained but 331. Assuming the evaporative power of the iron boiler to be 100, that of the cast steel was 117.26—showing an advantage of 17.26 per cent. of steel over iron.

A subsequent experiment was made in the same manner, but with the escaping steam kept at a slightly lower rate of speed, viz.: 195° of List's scale, instead of 220°, as in the previous trial. The result was 19.62 per cent. of evaporation of the steel over that of the iron boiler.

A third experiment was made in a different manner, as follows: A solution of salt was prepared and added in proportion to the quantity of water remaining in each boiler. After this had been well stirred and thoroughly boiled, the man-holes being closed, samples were taken for analysis. This trial, in which an equal quantity of fuel and water were used for each boiler, concluded the experiments. According to the analysis, it appeared that out of 100 cubic feet of water, the iron boiler evaporated 33.76 feet, and the steel boiler 40.81 feet—a difference in favor of the steel of 20.85 per cent.

The average of the above three experiments, gives 19.24 per cent. of evaporative power in favor of a 0.33-inch cast steel, over a 0.5-inch iron boiler. We presume that the strength of the thinner cast steel boiler is considerably in excess of the thicker iron, although no mention was made in the *Engineer's* account of that matter, or of the relative cost; both of which facts, as well as the relative durability of the two, are important considerations in calculating the economy of the one over the other.

## Scientific Miscellany.

ELECTRICITY is the science from which, above all others, men are now expecting great things. To it belongs the important scientific achievement of the age, the practical annihilation of time and space between the Old and New Worlds. Since it can do so much, why cannot it do more? Why not light our streets, heat our houses, drive our locomotives and steamships, and heal our diseases? Really, there is no saying what would be visionary in our anticipations of the future of this science; for it is still in its infancy. Now that the electric telegraph has been brought to perfection, or, what is the same thing, made as good as the world requires, the men who have addressed their skill for some years to the improvement of that one useful application of electricity to the wants of the race, will naturally investigate more fully the other, perhaps more wonderful, possibilities of the mysterious power. Already we find Mr. Wilde endeavoring, by his improved mode of generating electricity, to utilize this wonderful agent in the economic production of heat and light and power. The success which has already been accomplished in these directions is most promising for the future. The latest attempts to utilize electricity, is its application for the conversion of cast into wrought iron. We have chronicled whatever has been accomplished in each of the above mentioned experiments, and shall continue to keep our readers informed of whatever progress may be made in these important investigations. To investigate in science is to discover. The chief object of the *Press* is to spread discoveries before the people for the benefit of the masses. We shall endeavor to be ever faithful to our trust.

IMPROVED PROCESS FOR SEPARATING LEAD FROM SILVER.—In a factory at Holtrappel, in Germany, what is claimed to be an improvement has recently been introduced in the separation of silver and lead as follows:

The melted lead is poured into a crystallizing pan, and its surface covered with small fragments of coke, upon which a thin stream of water is permitted to run. The mass is slowly agitated with a circular motion, which insures the equal moistening and cooling of the whole surface. In about an hour the lead loses its fluidity, and forms a solid crust, which envelops the small pieces of coke. The stream is now turned off, the agitation stopped, and the unsolidified lead, rich in silver, is run off at the bottom. Before complete solidification takes place, strong iron hooks are inserted in the mass, and it is lifted by a crane from the pan, which is then ready for a second operation.

MAGNETIC PHANTOMS.—S. Mennier describes in the *Paris Cosmos*, a plan for preserving a representation of the curious figures produced when iron filings are scattered upon a sheet of paper placed over a magnet. His saturates the paper to be used with a warm solution of ferro-cyanide of potassium, and then dries it. For iron filings he substitutes pulverized magnetite or loadstone, which is placed upon the paper and submitted to the action of a magnet. After a beautiful combination of curves, called the magnetic phantom, have been made, pure hydrochloric acid gas is brought in contact with the paper and figures, and after a few seconds removed. The paper, being then freed from the loadstone powder, is washed very thoroughly; when dry a dark blue figure will show, with great delicacy of detail, the positions assumed by the pulverized ore under the influence of the magnet. The method is said to be more convenient and exact than the plan of covering the paper with a mixture of gelatine and starch, or paraffine and wax.

IMPROVED SYPHON FOR THE LABORATORY. M. Zaliwski-Mikorski has invented a new siphon, which he thinks likely to prove useful in the chemical laboratory. In using the ordinary siphon, it sometimes happens that noxious and even poisonous fluids pass into the mouth. The new siphon is not "set to work" by suction. One of its legs is provided with a small accessory tube, and by blowing through this latter the fluid moves along the siphon.

NEW APPARATUS FOR ILLUSTRATING WAVE MOTIONS.—Prof. Lyman of Yale College, has made an ingenious and simple apparatus, consisting of a white board about four feet long and three broad, in front of which and running lengthwise are two brass wires about one foot apart. Each is connected at short distances with a series of cranks by means of swivels. These cranks are connected behind the board by means of clock-work, so that all are set in motion by the revolution of one wheel, which is easily moved with one hand. The cranks are set at different angles to each other, and when put in action elevate or depress the wires, forming constantly varying curved lines, and thus representing the form of water waves. The lower wire shows the comparative decrease of motion at a depth below the surface having a fixed relation to the length of the waves. Prof. Lyman proposes to simplify his apparatus by dispensing with the numerous toothed wheels and substituting a simpler connection. When this is done, its cost need not exceed \$10 or \$15.

A NEW MODE OF PRODUCING ICE has been devised by Mr. A. A. Low, the celebrated aeronaut, of New York. It is a well known fact that the process of evaporating condensed carbonic acid gas absorbs an immense amount of heat and produces a corresponding degree of cold. Quicksilver is speedily frozen by this process, and the thermometer is said to show 275 degrees below zero. Mr. Low has invented a machine which is said to make this agency available for the manufacture of ice or the production of cold, and that, too, at a very limited expense. He thinks he can manufacture ice at three dollars a ton in any part of the world. The machine is so arranged that it economizes the material, and uses the same gas, with very little waste, over and over again.

A NEW METHOD OF PRESERVING THE DEAD.—There is on exhibition at the Morgue, in New York city, the body of a man that is being subjected to the experimental process of preservation. The body is that of a drowned person, and supposed to have been in the water three days prior to its recovery. It is inclosed in a metallic case, perfectly air tight, and, as yet, although forty days have elapsed since the commencement of the experiment, shows no signs of decomposition. On the contrary, the body hardens each day. The result is obtained by forcing the air from the case and supplying its place with a certain gas, which this discoverer claims contains the requisite preserving qualities. He even expresses the belief that the body in course of time will become as hard as stone.

MOVING PHOTOGRAPHS.—M. Clouet, by an adaptation of the Phenakistoscope—Thornatropie toy improved—has made moving photographs. The well known fact that the retina retains an impression a short but still appreciable time, and that a second impression being given a subtle mental action—possibly only physical—connects the two by supplying the "missing link," is the principle of the new arrangement. A portrait of a figure striking and of another receiving a blow, when rapidly opened and closed before the eye opposite which they are placed, take the appearance of actual motion in M. Clouet's process, which promises to be a popular and novel arrangement of the photographic art.

ANTIDOTE FOR CHLORINE INHALATION.—Prof. Malsch says that a direct antidote to the poisonous effects of the inhalation of chlorine is sulphureted hydrogen, the halogen combining instantly with the hydrogen, liberating sulphur. The professor has tried it himself after accidentally inhaling chlorine, and obtained immediate relief. The same remedy would doubtless be effectual in cases of bromine poisoning. The knowledge of this fact may be of service to persons employed in the works for the chlorination of gold in this State.

A NEW ALLOY has been introduced in Paris, under the name of *two-argent*, or trisilver. It is composed of 33 per cent. of silver, 25 or 30 per cent. of nickel, and 37 to 52 of copper. The compound is not homogeneous, but is rendered malleable by a secret process. In color it is similar to platinum, takes a high polish, is extremely hard, and is not affected by exposure to the atmosphere.

GRANULATED GUN COTTON is offered for military purposes, by a process which consists in reducing the gun cotton to a paper pulp, solidifying it by pressure, cutting it up and finally varnishing the grains with collodion. Or, the pulp is mixed with a small proportion of gum or collodion and agitated in a vessel until granulation results.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

68,978.—ORE CONCENTRATOR.—Lewis Goodwin and S. A. West, San Francisco, Cal.:

We claim, 1st, The concave rotary pan, A, A, with circular rifles, g, p, g, g, g, g, having an elevation toward the periphery of the pan, substantially as and for the purposes described.

2d, The discharge box, E, receiving the discharge at the periphery and discharging toward the center, having teeth or agitators attached to it for operating in the rifles and movable bar, L, to act on the pulp and water, and the gate, R, for cutting off the discharge, substantially as described.

3d, The plow, O, valve, 4, spring, 5, cams, J and K, or their equivalents, substantially as described for the purpose set forth.

4th, The stationary circular troughs, P, for receiving the sand and debris and G, for receiving the sulphurets, and the scrapers, N, attached to the rotary pan and working within the troughs, P and G, substantially as described.

5th, We claim the above described parts when employed separately or in combination, for the purposes specified.

The object of this invention is to provide an improved concentrator for concentrating sulphurets from their ores. It consists of a circular concave disk, with rifles or grooves, the machine having a continuous rotary movement. The ore or pulp, with water, is received at the center, and is carried by bent tubes to near the center, and from thence, by centrifugal force to the periphery of the disk, the heavier particles settling in the rifles in its passage; the sand and debris being separated by the current and constant agitation, are carried out by means of a trough or sluice, placed transversely across the disk to the center, and are discharged through openings into a stationary circular sluice or box below, while the sulphurets are discharged at the periphery of the disk, by means of a plow into another stationary circular sluice below.

Other devices have been employed, circular in form, with a groove for retaining the sulphurets, until the sand has become separated from them, and then discharged at the periphery; but these machines depend upon a cam or eccentric motion for separating the sand from the valuable portions, and oftentimes the machine must be stopped and assistance rendered, in order to proceed properly with the work.

69,025.—FURNACE FOR SMELTING ORES OF SILVER.—A. H. Richardson, Denver, Colorado:

I claim a smelting furnace having the blast supplied upon the ores in a furnace-box provided with an apron, in manner as above set forth, and furnished with three apertures at different levels, in manner and for the purposes substantially as above set forth and described.

## RECENT INVENTIONS.

A WRITING MACHINE.—A desideratum long sought for in the shape of a practical writing machine, it is said, has been invented by a Mr. Pratt, of Alabama. It is called a type writing machine, and has been exhibited before the London Society of Arts. It is said to print a man's thoughts twice as fast as he can write them with the present process. By a sort of piano arrangement the letters are brought in contact with carbonized paper, which is moved by the same manipulation. The machine is compact and simple, and can be made for \$15, with a handsome profit. Its feasibility is manifest. Legal copying and the writing and delivery of sermons and lectures, not to speak of letters and editorials, will undergo a revolution as remarkable as that effected in books by the invention of printing, and the weary process of learning penmanship in schools will be reduced to the requirement of the art of writing one's own signature and playing on the literary piano above described, or rather on its improved successors.

IMPROVEMENT TO THE DRILLING MACHINE. From the constant efforts which are being made in various parts of the world to drain and perfect a practical power drilling machine, little doubt need be entertained but that the desired achievement will be ultimately attained. The machine in use at the Mount Cenis tunnel, seems, indeed, to be

already a success; but either from its complexity and the skill required in operating and keeping it in order, or for some other reason, it does not yet seem to have been made applicable in small or individual operations—the place in which, after all, the machine drill is most needed.

One great difficulty which has been felt by most inventors of these machines, has been in making them self-adjusting, as regards the feed—and at the same time sufficiently strong. Professor Wood, of the University of Michigan, with his associate, Prof. Robinson, have, it is claimed, invented an arrangement which entirely overcomes the difficulty. If this be the case, a great point will have been gained; for the question of abandoning all attempts to perfect machines for this purpose, and resorting to hand drilling only, has been seriously discussed, in reference to the Hoosac Tunnel. The defect to which we have alluded, was the cause of such frequent breakage of drills, as to make it a very expensive matter to keep up the supply.

A DOUBLE-EYED NEEDLE.—Mr. Matteson, of the firm of Matteson & Williamson, of Stockton, have invented a double-eyed needle, for use on sewing machines. It is said to be quite simple and effective.

A NEEDLE MACHINE.—Dr. Crosby, of New Haven, the inventor of the machine for making pins, has perfected another machine which turns out a perfect needle without touch of human hand, except in the tempering of the wire. The American Fish Hook Company of that city, of which he is President, uses an invention of his which drops a hundred perfect fish hooks each minute into a pail at one end from a coil of wire at the other. Dr. Crosby is evidently an ingenious man.

NEW GUN LOCK.—We were shown yesterday, says the *Tulare Times* of Oct 5th, a gun-lock, that will prevent in future the many accidents happening by the premature discharge of fire-arms. The lock is set upon a plate as other gun-locks; it has no tumbler or dog, but has a safety key which prevents the hammer from falling upon the cap until the marksman is ready to fire. It is the simplest and safest thing of the kind ever offered to the public. The inventors are John Crabtree and J. Belden, of Tule River. They have taken steps to secure a patent, and we cannot doubt will be amply rewarded for their skill.

A NEW TEXTILE.—By a late patent, a species of nettle, which grows luxuriantly and spontaneously throughout the Mississippi valley, is employed in the manufacture of cord, rope, cloth, bagging and paper. The stalks, which grow from four to eight feet high, are gathered in the winter, and are ready for the break without any rotting process. The fiber is said to be exceedingly fine, strong and susceptible of high finish by dressing.

THE NEXT WORLD'S FAIR.—Although Vienna has been quite prominently spoken of as the locality for the next World's Fair, there seems to be a very strong disposition, on the part of the French and English, that New York should be selected. It is thought that the experience furnished by the Paris Exposition will be better utilized towards making a grand success, in New York than in Vienna. It seems to be conceded that no people grasp at an idea so quickly, or work it out with such practical vigor, as the Americans do. The most casual hint thrown out by a journal is often sufficient, in their hands, to give birth and material to a mighty design.

THE STATUS OF EUROPE.—Prussia and Austria, having settled their big fight, are acting like loving sisters; Russia seems to be getting into a bad fix with all the Great Powers, except the United States, which manifests an evident inclination to stand by her; Italy is in no decent order at all; France is looking quite perplexed; England ditto; and terribly nervous about Fenianism; Spain cannot look up at all, and never will; Turkey is very much ditto, and greatly in want of a main-spring; Sweden and Norway are looking decidedly healthy and contented, and give most encouraging signs of progress.

The last New York Legislature has passed a law requiring all railroad employes to wear a uniform—coat and pants of dark blue, a cap of light blue, with two bands of gold lace. Brakemen wear the cap only. Station-men are not uniformed.

NEW LAST FACTORY.—Mr. Levi Shepherd has just started a last factory at No. 10 Stevenson street, near First, in this city. He is now turning out 150 lasts per day, with the aid of four men. The California laurel is the wood which is being used at present, although it is the intention of the proprietor to experiment with several other kinds of woods, with the view of testing their qualities and value for lasts. The machinery used is of the most improved construction. The factory starts with excellent promise of a fine business. Several orders have already been received from Oregon and Nevada, and a large number from this city. This is the second last factory which has been started on this coast. We understand that the Oakland factory has been removed to this city, which seems to be the headquarters of all kinds of manufacturing business.

CALIFORNIA SEEDS FOR RUSSIA.—It appears that the Russian Minister at Paris was very anxious to purchase the fine lot of California seeds placed on exhibition by Mr. Perkins, of Oakland; but Mr. P. had already presented them to the French Government. Learning the desire of the Minister, Mr. P. has put up another collection, which he has presented to the Russian Government through its Consul, Mr. Wilkinson, at this port, and the Russian Minister at Washington. The seeds went forward by the last steamer. If they produce as large vegetables in Russia as they do in this State, they will give parties who see them there a good idea of the great productiveness of the soil and climate of California; but the difference in climate must prevent such a result to its fullest extent, although the product will, quite likely, be superior to that from the long used native seed.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

DISPATCH PRINTING AND PUBLISHING Co. San Francisco. Oct. 11th. Capital stock, \$7,000; seven shares, \$1,000 each. Trustees: James J. Ayres, Henry M. Biden, William Saunders, William H. Tobey, M. J. Edgar, John McFetrich and Peter Daley.

PERALTA HOMESTEAD ASSOCIATION.—Oakland. Oct. 15th. Capital stock, \$50,400; 350 shares, \$144 each. Trustees: George Barstow, Charles Main, R. H. Winchester, G. W. Dam, W. H. Howland, A. J. Gladwin and John M. Todd.

PACIFIC WOOLEN MILLS.—San Francisco. Oct. 17th. Capital stock, \$40,000; 1,000 shares, \$400 each. Trustees: James Roberts, Geo. F. Bragg and Donald McLennan.

JUDGMENT AGAINST A MINING COMPANY. In the Fifteenth District Court, on Thursday, in the case of G. D. Roberts vs. The Mammoth Gold Mining Company, judgment was ordered in favor of the plaintiff on defendant's default, for the sum of \$19,326 38, with interest and cost.

"WHAT Some of our Miners are Doing," will appear next week.

Mineral Land Law Blanks  
FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
  - II. Diagram, Description of Diagram and Boundaries, and Notice.
  - III. Register's Order for Publication—with Notice.
  - IV. Deposition that Notice has been Posted.
  - V. Application for Survey Etc.
- PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.
- Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. ... at ... P. O. ... County, ... State, to Mr. ... at ... P. O. ... County, ... State. .... 186-"

## Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

## REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, be in no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

## Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,  
San Francisco, May 24, 1868.

Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITTREDGE & LEAVITT,  
Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safe and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SIMS,  
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

1st.—Because it is impossible for either burglar or expert to pick it.

2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SHEPMAN, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SHEPMAN, County Clerk.

CALIFORNIA LOCK AHEAD.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it specifically meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—(Mining and Scientific Press, Sept. 29, 1868.)

They are the only SAFE lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—(Amador Ledger.)

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—(Sacramento Union.)

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARKE & C. FLEISHEL,  
No. 18 Post street.

## REFERENCES:

R. COSNER, Sheriff.  
O. WALTHER Treasurer.  
W. JENNINGS  
O. H. INGALLS, } Supervisor.  
L. McLAINE, }

Any good locksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—(See page 30 in Pacific Coast Directory.)

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, }
October 19, 1867.

Money Market.

The money market continues to be abundantly supplied with capital, and business requirements are freely met at rates long current—1 1/4 per cent. per month, prime first-class paper being mostly negotiated at the inside figure. Upon mortgage, re-payable in instalments, loans continue to be made at 10 per cent. per annum. The amount of available capital in the various savings societies continues large; however, the demand upon these and the other numerous sources of supply, especially for the purchase of real estate and improvements thereon, continues unabated. Trade generally is quite active, and altogether we note a very favorable degree of prosperity in most branches of business.

The receipts of Treasure through Wells, Fargo & Co.'s Express from the interior and coastwise since the 1st inst., have been as follows: Northern mines, \$1,890,824; Southern mines, \$179,534, and coastwise, \$136,000—showing an aggregate of \$2,206,358. The demand for Bullion is very fair, Gold Bars ranging from 890 to 900—most sales being effected at the outside rate. Silver Bars are in ordinary supply, selling from 4 1/2 per cent. discount to 1/2 per cent. premium, choice lots commanding 3/4 per cent. premium.

Exchange ruled as follows at the close of business yesterday: Currency Bills on the Atlantic cities, advanced to 40 per cent. premium on Gold; Sight Drafts, payable in coin, 2 per cent. premium; Telegraphic Transfers, 2 1/2 per cent. premium; Sterling Exchange, for best bankers' bills, 4 1/2; Commercial do, 4 1/4 @ 4 3/4; 5 fra for 30-day bills on Paris.

Telegraphic advices from New York of the 17th, quote Gold 144 1/2; at 3 P. M., an advance of 1 1/2 over the price at which it opened in the morning. Sterling, 109 @ 109 3/4. Five-twenties sold at 111 1/2, and 7-30s at 104 1/2.

A considerable amount of Legal Tenders was sold during the past week in the Board, mostly at buyers' option, ranging from thirty to ninety days, at 70 1/2 @ 71 cents.

The duties paid at the Custom House in this city since Oct. 9th, and previously this year, have been as follows:

Table with 2 columns: Date and Amount. Rows include October 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, and totals for October to date and previously this year.

The shipments of Treasure from October 1st to date have been as follows:

Table with 2 columns: Date and Amount. Rows include October 7-Per California to Victoria, October 10-Per Montana to New York, October 14-Per China to Hongkong and Japan, October 14-Per Idaho to Honolulu, and totals for October 1st, previously this year, and since January 1st.

City Stocks.

We have to report continued apathy in this class of stocks, holders, for the most part, showing no disposition to enter the market. Insurance stocks are apparently in better favor than for some time past, though the public offerings are very light. Since our last reference the California and National companies have concluded to disburse their usual quarterly dividends, the former paying 6 per cent, and the latter 3 per cent. The Fireman's Fund and Union have placed their earnings to the surplus fund, deeming it proper not to declare a dividend at this time. The Spring Valley Water Company paid its usual dividend of 1/2 per cent. per month on the 10th inst. This stock sold at \$69 @ 68 50 during the past week. The California Steam Navigation Company paid a dividend of 1 1/2 per cent. per month on its capital stock on the 15th inst. This company has not disbursed any dividend since January last, when it paid 2 per cent. Sold at 74 @ 73 1/2 per cent. within a few days, closing at 73 1/2. North Beach and Mission Railroad is in better favor, selling a few days ago at \$53 per share. All the city railroads, owing to repairs and other heavy expenses, have passed their usual dividends for the present month. At the close we note sale of twenty-five shares Sutter St. Railroad Co. at \$20 per share, and San Francisco Gas at \$68.

Mining Share Market.

During the past week the shares dealt in at the Board exhibit considerable improvement, though the market may be stated to have been comparatively quiet. Since the market has acquired more steadiness under decreased speculative operations and other influences, a better feeling seems to prevail, the general opinion being that stocks have about "touched bottom." It is somewhat singular as well as unfortunate that all the companies on the Comstock Lode are simultaneously required to carry their operations to greater depths, in order to obtain pay ore, which fact greatly accelerated the recent depression, and is now in some instances requiring assessments where dividends were looked for. Crown Point—sold rather freely during the period under review, opening at \$690, advancing to \$775, receding to \$700, and closing yesterday at \$796. The drift from the 700-foot station toward the ledge progresses slowly, on account of the presence of a large body of water; distance made, 89 feet. At present the 500-foot level is producing considerable ore of a good quality. The product of the whole mine averages nearly sixty tons per day, and it is believed that the average yield for the current month will be about \$40 to the ton. The haulion returns from the 1st to the 14th inst. foot up \$17,000. An

assessment of \$25 per share, or \$100 per foot, was levied on this stock on the 12th inst.

HALE AND NORCROSS—is in better favor, advancing from \$550 to \$750, receding to \$650, and closing at \$700. We are informed that the ore on the 175-foot level is fifteen feet wide, and will mill from \$20 to \$35 per ton on the 300-foot level the ore is six feet wide, valued at \$20 @ 25 per ton. The opinion prevails that the ore found on the 175-foot level is a different strata from that obtained on the 300-foot level, and it is thought will improve in quality so soon as operations will be carried under it. It is ninety feet further north where they have penetrated the vein on the 800-foot level than the point at which work is now prosecuted on the 175-foot level.

CHOLLAR-POTOSI—has been actively dealt in at a decline, receding from \$216 to \$185, improving to \$192 50, then selling at \$184, and closing at \$190. We have no material change to note in this mine within the past week. During the week ending October 11th the new Santa Fe station produced 320 tons of ore, the old Santa Fe 400 tons, and the Potosi shaft, north and east, yielded about 40 tons per day. The amount sent to the custom mills during the same period was 1,439 tons. The drift running to the south and east from the third station passed over the extreme end of the southern drift of the old Chollar lowest level, and the ore found there is said to assay \$30 to the ton.

SAVAGE—has been less active than for some time past, opening at \$124 @ 123, declining to \$117, rallying to \$119, receding to \$115, and at the close selling at \$115 50. During the week ending October 12th, 1,873 tons of ore were extracted, showing an approximate assay value of \$72,170, or an average of \$38 55 to the ton. The north mine, on the seventh station, produced 829 tons of the above amount, and the north and south mines, on the third level, 885 tons. The Potosi chimney continues to look well, and is now said to have a fine body of ore. Both north and south on the third level the main breasts show some improvement over the previous week. It is thought that a good body of ore will be found in the north Potosi chimney, to which point they are now carrying a drift. The north winze from the third station, it is said, again shows good ore. The fifth station, which is now being opened, is 750 feet from the top of the shaft, and 920 feet below the surface of the old shaft.

KENTUCK—under considerable sales, advanced from \$245 to \$260, fell to \$234, and closed at \$236. We have nothing of especial interest from this mine. The receipts of haulion at the office in this city from the 1st to the 14th inst., amounted to about \$25,000.

YELLOW JACKET—sold within a range of \$360 @ 405, and at the close realized \$430, seller 5. An assessment of \$100 per share was levied on the 12th inst.

OVERMAN—improved from \$35 to \$42, then sold at \$39, and closed at \$50. They are taking out about 100 tons of low grade ore per day, which pays but a small profit over expenses. It is believed that better ore will soon be obtained. On the 16th inst. nearly \$3,000 in bullion was forwarded from the mine.

GOULD & CURRY—opened at \$310, receded to \$285, advanced to \$295, and at the close \$285 was bid. All the ore this mine at present produces is taken from the chambers between the D street level and the Long Tunnel, and a larger amount is obtained than was anticipated. IMPERIAL—steadily rose from \$114 to \$139, declined to \$122, then sold at \$137 50, and closed at \$133. The haulion product from the 1st to the 11th inst. amounted to \$13,863, a trifle less than during the same time in September. The mine is said to look more promising.

OPHIR—was in the market to a limited extent at \$40 @ \$34, closing yesterday at \$38. The hoisting works are nearly completed. The Superintendent advises that they will be started up on Monday, the 21st, and that they will be of ample capacity to keep the shaft clear of water. Sinking will be resumed at once. The foundation for the pumping machinery is being put down, and haulings over the shaft are going up. Some ten tons a day of about \$30 ore are being taken out by contract from the old upper levels. The contractors expect to increase the quantity when they have completed a tunnel to connect with the Union Tunnel.

GOLD HILL QUARTZ—meets with little inquiry; at the close we quote it at \$95 bid and \$100 asked. The mine shows no change and the supply of ore continues good. During the week ending Oct. 14th the ore averaged \$30 60 to the ton—an improvement over the previous week of more than \$5. The receipts of haulion to date amount to about \$5,100.

CONFIDENCE—a few feet sold at \$35. We have nothing of importance from this mine. The third annual meeting of the stockholders of this company will be held on Friday, the 8th of November next.

ALPHA—sold at \$550 @ 520. EMPIRE MILL realized \$130 @ 155. BELCHER was in limited request at \$90 @ 95. Assessment of \$15 delinquent on 21st inst. BULLION sold at \$16 @ 19, and at the close \$18 is bid. SIERRA NEVADA sold at \$11 @ 11 50, assessment of \$10 delinquent. JUSTICE and INDEPENDENT at \$2 50 @ 2 75. An assessment of \$10 per share will be delinquent on the 23d inst. EXCHEQUER sold at \$8 per share; and SEGREGATED BELCHER at \$4 50 @ 5. DANNEY was in the market, at the close, at \$10 @ 8.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last amounted to \$7,000. The sales in the open sessions, from the 1st to the 17th inst., inclusive, amounted to \$1,505,600, showing a combined aggregate to date during the current month of \$5,067,186.

MEUSSDORFFER, San Francisco Market Rates. No. 635 and 637 Commercial Street, WILL INTRODUCE On Saturday, February 9, 1867, An Entirely New Style of Cloth Cashmere Hat "YACHT HENRIETTA," Which are the most dressy Hat ever introduced on the Pacific Coast. 8v14

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, and DAY OF ASSESSMENT. Lists various mining companies like Ancient River, Belcher, Belcher, Baldwin, Abner, etc., with their respective details.

Latest Stock Prices Bid and Asked.

Table with columns: MISCELLANEOUS STOCKS, RAILROADS, BANKING INSTITUTIONS, INSURANCE COMPANIES, and MINING STOCKS—WASHOE DISTRICT. Lists various stocks and their bid/ask prices.

Table listing various goods and their prices, including Coffee, Costa Rica, Do. Rio, Tea, Japan, Do. Ceylon, Hawaiian Rice, China Rice, Canned Goods, etc.

Table titled 'Retail Prices' listing items like Butter, California, fresh, do. pickled, do. Oregon, do. New York, Cheese, Honey, Eggs, etc., with their prices.

San Francisco Metal Market.

Table titled 'PRICES FOR INVOICES' listing various metals and goods like Tin Plates, Copper, Sheet, etc., with their prices.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA. Rates of Subscription. (Invariably in advance.) One year, \$5.00; Six months, \$3.00; Three months, \$2.00. TERMS TO CLUBS: Three copies one year, \$12.00; Five copies one year, \$18.00; Ten copies one year, \$35.00. An extra copy free for one year to the person sending a club of ten subscribers. Send money to our office in registered letter, or by Express, Address, BROOKS & CAPP, San Francisco. Boiler Makers Wanted. WANTED—GOOD BOILER MAKERS, (THAT ARE NOT W. Society men) to whom steady employment will be given. Apply to COPPEY & RISDON, Boiler Works, Bush and Market streets. 13v16-w American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Calaveras County.

*Chronicle*, Oct. 12th: The Mokelumne Hill and Campo Seco Canal and Mining Co. who have been engaged for a number of months past in extending their ditch to Cat Camp, have nearly completed the work. The section of country around Cat Camp which has been prospected sufficiently to warrant the Water Co. in making the large outlay which the extension of their ditch necessarily involved, is extensive, and will afford a profitable field for mining enterprises for years. A large number of claims have already been located; in fact, nearly that whole section of country is now taken up. When the water arrives, work will be immediately commenced, and a large body of idle men transformed into producers. The activity and enterprise exhibited by the water company, and the promptness with which they afford every facility in their power for the development of the mineral resources of the county, are deserving of the highest praise and commendation. Had they not have taken hold of the matter, and but for their abiding faith in the extent and durability of our mines, the rich placers of Cat Camp would never have been compelled to yield up their golden treasures. Calaveras now offers superior inducements to those wishing to engage in mining pursuits, either as laborers or capitalists. Although the placers are exhausted in many localities, hydraulic mining is yet in its infancy. The entire county is covered with a net work of ditches and flumes, from which water can be obtained at reasonable rates. Water is furnished those who wish to prospect, in this vicinity, gratis. Untold wealth lies hidden between the walls of numberless quartz ledges which only require the aid of capital to become inexhaustible treasures—national banks upon whose bills there is no discount. Capital is the key which can unlock the doors of these vaults, and but few years will elapse before it is brought into requisition.

A quartz lead was discovered by some Mexicans a short time since, near the Junction, which bids fair to prove one of the richest in this vicinity. A shaft has been sunk upon it to the depth of 25 or 30 ft. and a lode three ft. in width, all of which prospects handsomely, disclosed. Parties who have the means to develop it thoroughly are trying to purchase it, and if successful, we have no doubt but they will become the possessors of one of the most valuable ledges in the county. Its discovery has created quite a furor among quartz miners in this vicinity.

Messrs. Sheldon & Cole, the gentlemen who leased the celebrated Old Shields quartz lead, at Rich Gulch, are progressing rapidly with its development. Hands are at work night and day, sinking the shaft. The rock taken out is hauled to the French mill and crushed; it pays handsomely. The lead is a very wide one, and promises to prove valuable.

## Kern County.

*Havilah Courier*, Oct. 12th: The new El Dorado Dist. in the southern portion of this county, is proving to be one of the richest in gold quartz ledges of any of the mining districts heretofore discovered in Southern California. Upon a late examination, we were shown rock from a dozen different ledges in the district—upon which the different proprietors are now busily at work developing—which were exceedingly rich, literally flocked all over and spangled with gold.

The St. John Mining Co's mill is running 12 stamps day and night. It has been steadily at work since its completion. The St. John mine is now fairly opened and prospected; the ledge is what is termed flat—having a dip of not exceeding 15° from level, making it very easy for working purposes, and as yet requiring no hoisting machinery to raise the ore from the shafts, it being wheeled or run out on cars. There are several shafts run in upon the ledge. These shafts are from 50 to over 100 ft. into the ledge; a level is then run from the extreme shaft along the ledge for a distance of between 200 and 300 ft. The vein of quartz thus exposed is quite regular, and averages 20 or 21 in. in thickness. There is now in sight from 4,000 to 6,000 tons of quartz. The first crushing of 100 tons at the mill yielded \$40 per ton. On Sunday last, Supt. Taylor opened one of the batteries, after running six days to give us a peep therein; the sight was pleasant to behold—half a peck or less of amalgam met our covetous vision. It is confidently believed this run of the St. John rock will pay at the rate of \$50 per ton.

There are many other mines in this district which are confidently believed to be equal to the St. John; indeed it is claimed by experienced miners that there are several mines in the district that have a greater body and richer ore. Before the 1st of January we may expect several more mills in operation in the new El Dorado Dist.

The Delphi mine continues to pay as of old. Mr. McKeadey crushed 20 tons last week which paid some \$40 per ton—the ore being mixed with considerable refuse stuff and granite. Mr. McKeadey states that he has but some 15 to 20 ft. further to strike the Delphi at a depth sufficient to furnish rock for his mill for a year to come.

## Mariposa County.

*Mail*, Oct. 12th: Mr. Mark Brummagin, President of the Mariposa Co., in a statement recently made of the condition of the company's property, states that since the property has come under the present management, the Bear Valley mill has been changed into the Eureka process for saving gold. With this mill the company have recently worked some 800 tons of quartz from the Josephine mine. The lowest yield at any clean up was \$31 per ton; the highest was \$173 per ton; giving an average of \$40.53 per ton. In the greater portion of this quartz, not a particle of gold could be discerned before crushing.

The same paper says that steps have been taken to reorganize the Mariposa and Merced South Fork Canal Co. upon a permanent and practical footing for the purpose of supplying water to extensive and rich placer mining districts, hitherto unproductive for the want of water.

The Mariposa mill and mine will at an early day be placed upon a basis for profitable operations.

A Chinaman, while scraping about in a vacant lot in the neighborhood of Chinatown, on Monday last, picked up a piece of gold which proved to be worth \$507. There was great rejoicing in the camp of that celestial.

## Nevada County.

*Gazette*, Oct. 11th: The machinery of the new hoisting works on the Dromedary mine works admirably. The work of pumping out the old shaft has progressed without interruption, and the water has been lowered to the depth of 150 ft. The shaft is 275 ft. deep, and before many days will be entirely relieved of water. It is the design of the company to commence taking out ore from the second and lower levels as soon as they are accessible.

A lot of 150 tons of rock from the Harvey ledge, near Wood's Ravine, was cleaned up yesterday at the Nevada mill, and yielded \$20 per ton.

Oct. 14th: J. A. Pierce, one of the lessees of the mill and mine of the Star Co., in Washington township, states that they have put the mill in running order, and for some days have been engaged in crushing. They started a tunnel on the ledge, and have run it about 40 ft., and are now taking out about 15 tons a day, which is sufficient to keep the mill running. The rock is paying \$18 per ton.

Mr. E. S. Hugill, the discoverer of the Birchville ledge, near Eureka, has sold out his interest in the mill and mine, to the other members of the company, for \$4000. His interest was one-tenth.

Oct. 15th: In Washington district there are seven or eight companies at work in gravel claims—all doing well.

Messrs. Harroun, Randolph, Goodrich & Wilkinson, on Rocky Bar, have one of the richest gravel claims in the county, and will realize a fortune this fall.

Mr. J. D. White, our Assemblyman elect, owns the adjoining claims, and another year will realize a handsome fortune.

Mr. Woolsey, at the Tecumseh mill, Fidelity mine, is taking out a large amount of ore, which gives good returns.

Mr. Arrington is working several ledges, which, from several crushings at the Tecumseh mill, gave highly satisfactory results, paying from \$30 to \$50 per ton. This is the result obtained from undeveloped mines, giving evidence of the richness of ledges in this section.

The Mary Etta, recently purchased of Spring & Co. by a San Francisco company, is being thoroughly developed, the company expending a large amount of money. They have a large quantity of ore in sight, showing free gold and rich sulphurets.

The Star mine, leased by Pearce & Jones, is now being worked in a thorough and judicious manner, which will undoubtedly give good results.

An old mine and mill, worked years ago, situated below the Star on Cañon Creek, is now being resurrected by a party of Cornishmen, who are sanguine of making it pay.

Lower down on the creek is the New Discovery, having a fine ledge five feet in width and containing rich ore. The parties have

refused \$10,000 for it. Still lower down, near the mouth of the creek, the Lindsey Bros. have a fine ledge, containing a great amount of free gold and very rich sulphurets.

The construction of the mill of the Norridgewock Co. is now well under way, the foundations having been excavated, the frame put up, and most of the machinery and timbers for the battery being on the ground. The mill is to have ten stamps, and will be run by a powerful steam engine, which will also be used for running the pump. The work of running levels and drifts in the mine is still continued, and by the time the mill is ready for crushing it is calculated that the mine will be in a condition to keep the 10 stamps employed. The incline shaft is down 300 ft., from whence levels have been run north and south along the ledge. We are informed by the superintendent that they have a five-foot ledge in the north level, the rock being of good quality. The quartz resembles very much that in the Wigham mine, and the ledge is in the same range.

Grass Valley Union, Oct. 13th: At Eureka there are three steam quartz mills running. The Commercial is a 10-stamp mill, having two of Heudy's Concentrators. The Birchville is a mill of 5 stamps. Both of these companies are crushing rock from their own ledges, and doing well. Black & Young's is a mill of 10 stamps, having several of the Knox pans. This is an excellent mill, and during the season has been engaged in doing custom work. A run of 160 tons of rock from the Banberry & Young ledge has just been completed, and yielded \$20 per ton. The Sweet ledge is again being worked, and is looking well. A San Francisco company, owning a series of ledges, is engaged in extensive prospecting to open their claims, and are confident of opening valuable mines. They are running a tunnel by which they will cut several ledges, and have large bodies of ore above the drift. A new ledge has recently been discovered and located by Messrs. Black & Co., on Roscoe Hill. The ledge is large, and the locators consider it the main or mother ledge of the district.

EXCELSIOR.—Meadow Lake Sun, Oct. 5th: The editor has paid a visit to the famous Green Emigrant mine, and says the rock looks splendid. Seeing a horu near the shaft a gentleman who was with us horned out a small quantity of rock which he had partially reduced in a mortar, and from this he obtained the finest prospect we have ever seen in the country. We were shown by Mr. Connell some sulphurets from the rock which assays over \$1,000 per ton. These sulphurets are to be sent below for working.

The Enterprise Co. are now busily engaged sinking the main shaft on their mine, and are making some fine developments. The ore looks better than at any other time since the company commenced work. A fine mill is in course of erection, and will soon be completed. The furnace for the roasting of sulphurets will soon be in working order.

The Star Co. are now at work on their mine day and night, and are showing some very fine ore. The ore is desulphurized and contains much free gold.

The Grant Co. are driving the work of developing their ledge with great vigor. Fine developments are constantly being made. The company now employ a large force, night and day, upon their mine.

The Kentucky Co. are driving their tunnel (from the flat by the lake) ahead in fine style. This tunnel will tap the ledge at the depth of 100 feet. The upper tunnel is also being pushed ahead, and a fine body of ore has been disclosed.

The Green Emigrant Co. have at last obtained a sufficient depth on their ledge to find its proper bearings. They have a depth of about 30 feet struck a well-defined ledge nearly eight feet in width. The ore is better than any heretofore taken out of the claim. The work is being pushed forward night and day, and in less than three weeks the company will have another 100 tons of ore worked.

The Excelsior Co. are engaged in running the old tunnel ahead, and good developments will be made in their quartz ere long. They intend to have some five or six tons of their ore worked at the California mill, as a test.

The Golden Run Co. are engaged in packing rock from their mine to the Mohawk and Montreal mill.

The Mohawk and Montreal Co. are pushing the work ahead on their mine with a greater vigor than formerly, and the rock is paying finely. The Mohawk is one of the best claims in the district.

Across Phoenix Lake lies the Camp Co's claim, Shooting Star ledge, one of the best defused ledges of the district.

One mile north of the last mentioned

claim lies the Eclipse, one of the richest prospecting claims yet opened. Hardly a piece of ore can be found but what shows free gold in considerable quantities. They are getting out quite a quantity of ore for crushing.

Oct. 12th: The owners of the Union mine, at Relief Hill, in this county, are about firing off a blast which will burn no less than 750 kegs of power. This will be the biggest blast ever set off in mines of this State.

## Placer County.

Auburn Stars and Stripes, Oct. 9th: Several extensions, some reaching as far towards town as O'Brien's place on Rock Creek, have been discovered, of the black lead discovered by McGonigle & Co., on Quartz Prairie. All seem rich, and McGonigle's constantly improves.

Dutch Flat Enquirer, Oct. 12th: Messrs. Kidder & Co. are opening their claims on quite an extensive scale, and will be ready to make their first run on or about the 1st of November.

Herald, Oct. 12th: The quartz in the neighborhood of Auburn seems to be still attracting considerable attention. Within the past week parties have been up from San Francisco, and have made liberal offers to invest in the Green Emigrant.

Quartz claims generally in the neighborhood of Auburn are looking up.

## Plumas County.

Quincy National, Oct. 5th: Compton & Wiles, of Round Valley, commenced operations in the old Round Valley mill, the first of last week, crushing quartz from their ledge near that place. Their first clean up, after a week's run, yielded \$8 per ton. They are preparing winter quarters for their ledge hands, and intend running the mill throughout the winter.

Batchelor & Viette, of Dixie Cañon, are crushing rock from their ledge at the head of Cherokee, and taking out an average yield of \$10 per ton.

A very rich quartz ledge has been recently discovered in Argentine Mining Dist., about a quarter of a mile above Sherman & Bros' mill. The ledge is about three ft. wide, and prospects enormously rich.

## Shasta County.

Courier, Oct. 12th: Robinson & Co. are energetically at work sinking a shaft on the Bullion ledge, at South Fork, and have struck rock which is pronounced richer in gold and silver than anything yet discovered in the district. After running a cut into the mountain side, a shaft was commenced and is now sunk 12 ft. The ledge at that depth is four ft. thick, well defined, and in many places contains native silver, spangles and threads of which are plainly visible to the naked eye.

## Sierra County.

Downieville Messenger, Oct. 12th: Anderson, of Chandlerville, has made a good thing this season. The Campbell claims, also, have paid fine dividends. The Barnes Co. have at last turned out beyond the expectations of everybody.

The El Dorado tunnel, of the Hawkeye Co., is being pushed ahead rapidly. Through their old tunnel they are working front ground that pays moderately.

In the Pittsburg claims they are taking out no pay as yet, but are driving tunnels to reach front pay, and expect to find paying dirt shortly.

The Monumental Co. has its timber and dump houses, shop and other outside fixtures complete in good shape, and in a short time will be operating on excellent "grit."

The Empiro Co's ground is being opened through the Monumental tunnel, of which they own a part. Other companies are doing well.

A company consisting of A. K. Bishop and others, of Alleghany, E. M. Purinton, Dewey & Vaughn and others, of Downieville, was organized at this place one day last week for the purpose of working a quartz ledge at Alleghany.

The castings and mill machinery for the Doelle Co. are on the ground. In the mine a tunnel is being run at a depth of about 150 ft. below the foot of the present incline to connect it for the purpose of getting ore ready for the mill. The rock in the incline continues to improve in richness, but water is coming in freely, and work will perhaps soon be suspended. A tunnel is being run on the adjoining ground, owned by Bovee & Co., and the second extension, (Johnson & Co.) is paying, as formerly, large dividends from a hand mortar battery, the rock in which no gold is visible to the eye paying at the rate of a bit per pound.

Meadow Lake Sun, Oct. 5th: The mines in and about Milton, in Sierra county, are paying very well. The claims of Holmes & Co., on the Middle Yuba, is paying very largely. Messrs. Cole & Beazely, of Meadow Lake, have a good claim near the last mentioned one. The water in the river is now

so low that there is no difficulty in working the river and bank claims.

#### Tulare County.

Visalia Delta, Oct. 9th: Almarin B. Paul, Mr. Wingard, the Broders and others at Independence, are working energetically to develop their mines, and although it seems to be a long time in coming, we all believe that the "good time" will come.

The Spanish Camp still attracts a large amount of attention, and considerable metal is being taken out, but divided amongst two or three hundred miners makes but little show. Mr. Dorr has gone to the city to prepare for more extensive operations and some tons of ore from 13 different lodes have gone to the city for practical working.

Mr. J. D. Carter, Supt. of the Philadelphia Co's mines at White river, reports the mines all looking well and the rock rich.

A. J. Malthy recently made a run of 30 tons from the Eclipse mine, which yielded \$95 per ton.

#### Yuba County.

Marysville Appeal, Oct. 10th: The Brown's Valley correspondent writes that the Big Rattlesnake Co. have extracted and had crushed at the Dannebroke Co's mill, 200 tons of rock, which yielded a little more than \$6.50 per ton.

#### ARIZONA.

Miner, Sept. 20th: Noyes & Curtis are taking some excellent ore out of the Montgomery mine. Pard Pierco is confident that the ore already mined out will pay \$200 to the ton.

#### COLORADO.

Denver News, Oct. 2d: The correspondent in Ward Dist., writes: The Columbia is the king of lodes in all the northern mining region. The Ni-Wot Co. were the first to commence its development. In their mine the rich ore in mass chanced to come near the surface. Their 50-stamps are now discovering the miner's music day and night. They produce from the bulk of unassorted ore \$3,000 per week, and from selected ore would yield \$1,000 per day. The machinery for working the mine is complete, but not the full reduction works. Mr. Davidson, the agent, proposes the immediate adoption of some process for saving the copper, and the large percentage of bullion that escapes the stamp mill.

East of the Ni-Wot, on the same vein, DeLand & Co. have developed a wide crevice, which is yielding well by the stamp mill. For their rich iron and copper pyrites, they propose introducing the desulphurization works of Reese, Krause & Bruckner, called the California process.

The same paper, speaking of the Live Oak Yankee Reduction Works, thus describes a new cylinder invented by Mr. Collins, of Central City. The cylinder in use is four feet in diameter by eight feet in length, lined with fire brick, and having a partition of fire tiles running from the back part to within 12 or 15 in. of the front opening, being so arranged that the flame passes on both sides of the partition. No iron is exposed in the interior. The wheels around the cylinder, which run on the friction wheels beneath, are cams, or rather one side oval. These wheels are placed diagonally around the cylinder, thereby making the center lino diagonally through the cylinder. This cylinder, in our judgment, possesses many advantages over any now in use here, from the effectual intermingling of the ores which naturally results from a lateral as well as a forward motion. One other advantage is the total absence of iron, or any other oxidizing substance in the interior of the cylinder.

We saw to-day 13 bars of bullion, whose combined weight was 691 24-100 ozs. They would coin on an average \$17 per oz., which would give a total value of \$11,661.08. The lot belongs to the different banks.

At the Colorado National bank, there is, (besides the two bars from the Cameron mine, and the one from Cherry Creek dust), six bars of bullion, whose weight and fineness was as follows: 15 43-100 ozs., fineness .769 $\frac{1}{2}$ ; 9 14-100 ozs., fineness .666 $\frac{1}{2}$ ; 25 31-100 ozs., fineness 885 $\frac{1}{2}$ ; 35 7-100 ozs., fineness .765; 48 57-100 ozs., fineness .767 $\frac{1}{2}$ ; 43 36-100 ozs., fineness .860. Their total value was about \$3,000 in coin. In addition to these bars was a large quantity of dust, which, with the nine bars of bullion, was valued at not less than \$18,000 in coin.

The development of leads in La Plata Dist., progresses rapidly and favorably, but will probably wind up in a week or two, so that the miners may get out before the snow storms set in.

The gulch mining in the neighborhood of Boulder is nearly ended for the season.

#### IDAHO.

World, Oct. 5th: The 25-stamp quartz mill of Classon & Co., at the Pioeuer ledge on Granite Creek, was put in operation one day during the week, for a trial of the ma-

chinery, and in every part the mill worked entirely satisfactorily. The engine and machinery runs wonderfully smooth, and exhibits strength and perfection throughout. In a few days the mill will commence operation on the ore.

At Bernsteil's there are some pieces of ore from the Archer ledge, Banner Dist., which are very rich in black sulphurets of silver, and one or two pieces show richly in gold.

#### NEVADA.

##### Humboldt.

Unionville Register, Oct. 5th: A connection between the Arizona and the Manitowoc works is now being made, which will thoroughly ventilate both mines for a long time to come. For several months past the Pioneer mill has been supplied and kept running on ore from these mines, while the process of development and opening out the mines for more extensive operations were going on. At the Arizona works there are in sight 100 tons of ore that will pay \$40 per ton; in the Manitowoc, considerably more than that amount, that will yield about \$100 per ton. As they gain depth, the ledges increase in size and the ore becomes richer.

The De Soto mine, in Star Dist., is now said to be a "big thing." The ledge in the lower level is about eight ft. in thickness almost solid ore of the finest quality of Sheba. The mine is being worked under the management of James Hendra, who has been with it since work on it was first commenced, but never saw it looking half so well at any time before.

Capt. J. S. Phillips is now superintending Mr. Torrey's furnaces. He has remodelled them and put things in shape generally. Mr. Torrey has out an immense amount of ore, and the supply is apparently inexhaustible. The furnaces were started up on Monday last. About \$20,000 worth of ore is broken up and ready for smelting.

The Oreana furnaces are now in full blast. Judging from the silver bricks piled up by the cord, from the capacity of the smelting works, and the thousands of tons of ore in sight at the mine, we have no hesitation in saying the Trinity and Sacramento Co. has one of the most valuable properties on this continent.

The Dun Glen correspondent writes that John Upham has refitted the small quartz mill owned and built by David Melarky. Upham and Melarky own the Jefferson ledge, in Gold Run Dist., and they expect to be able to crush a good quantity of rock daily from that ledge. The owners of the first south extension of the Black Hawk ledge, known as the Ward Co., in Gold Run Dist., have made arrangements to develop their mine. Everything looks very favorable, and the company expect to find plenty of pay rock from the start. They will commence work immediately.

##### Reese River.

Reveille, Oct. 7th: Three bars of bullion from the mill of the Belmont Co., arrived this morning on the stage from the east; also 3,000 ozs. of crude bullion from the mill of the Social and Steptoe Co., in Egan Cañon, arrived this morning on the stage from the east.

Oct. 8th: The operations of the Manhattan Co. are well calculated to establish confidence in this as the most valuable district in the region. For the two weeks ending the 5th inst., the 20-stamp mill of the company reduced 180 tons of ore obtained from the North Star mine, which produced 46,500 ozs. of bullion—at the rate of about 250 ozs. to the ton. As far as we are able to learn the mill has been producing largely for several months.

Last evening, seven bars of bullion, weighing some 6,000 ozs., were brought into town by Russell's stage from Cortez.

Oct. 9th: Since the opening of the Metacom mill, it has been conducted with the finest success. It is by far the most powerful 10-stamp mill in the Reese River section. The weight of each stamp exceeds 800 lbs., and drops 90 times a minute. There are six large barrels in the amalgamating room, and there are four reverberatory furnaces, but both departments are greatly behind the capacity of the battery, the power of which is wonderful. In a test of its capacity last week, it is claimed that it crushed 10 tons of ore in 12 hours. Several lots of ore from the Diana mine on Lauder Hill have just been reduced at the mill with handsome results.

Oct. 9th: We were shown yesterday by Chas. W. Harker, who just arrived from Silver Peak Dist., a number of samples of good quartz from the veins of Red Mountain, which are gold bearing. In several of the compact and firm pieces of quartz little points of gold were visible to the eye; but a yellowish decomposed article, of which there is an abundance on the surface, is said to be the richest in the world.

Yesterday afternoon the first lot of bullion produced by the mill of the Old Dominion Co. at Hot Creek was brought into the city. It amounted to 6,000 ozs., and was obtained chiefly from ore of the Old Dominion mine belonging to the company. The mill was put in motion before the buildings were covered, and the work was retarded greatly by the occurrence of heavy rains, otherwise the production of bullion would have been greater. The mill works satisfactorily, and its various departments are under the charge of experienced men. From present appearances there is likely to be more than sufficient custom ore to supply the mill, and already the owners of mines in Hot Creek and the adjoining districts are urging the addition of 10 stamps. The Old Dominion mine is improving daily in appearance and in the quality of its ore, although it is scarcely opened below the surface, and it is believed that it could fairly supply ten stamps.

Oct. 11th: Ten tons of ore from the Buckeye mine has been packed to the mill of the Twin River Co. in Ophir Cañon, for the purpose of being tested. A further test will be made at the mine, where a small smelting furnace is nearly completed. It will hold several hundred pounds of ore—quite sufficient to determine whether or not it can be reduced in that way with economy.

Yesterday a pack train arrived at the Metacom mill with two tons of ore from the Eclipse ledge in Summit Cañon in the North Twin River Dist. The ore was sent in for reduction by the superintendent, because it was believed to be worth the experiment.

The ore from the Diana mine on Lauder Hill has improved greatly. Thirty-two and a half tons have just been reduced at the Metacom mill, the assay of the pulp of which was at the rate of \$271 per ton.

Matters are progressing very quietly but encouragingly in the Mammoth Dist., as we are informed by G. W. Emerson, who returned from there a few days ago. Captain Knapp was steadily developing the property of the Mt. Vernon Co., through shaft and tunnel. The tunnel, which was projected to cut upwards of 20 veins in the length of 1,000 ft., has been pushed in the hill 700 ft., in the course of which several veins have been cut. A good working shaft has been sunk to the depth of 150 ft., intersecting the tunnel at the depth of 65 ft. One ledge of the width of 23 ft. has been cut through in both shaft and tunnel. It produces a good quality of ore, samples of which were shown to us in the assay office of David Lundbom. Some of the pieces showed a good tint of ruby. Mr. Emerson examined the ledge where it was developed in the tunnel, and observed mineral in the mass, but several strata of fair width would produce ore, he thought, that would yield \$100 silver per ton. What is still better, in his judgment, the entire vein would produce ore within the present milling range. The grade of ore developed in the lower drift of the shaft had greatly improved, and Mr. Emerson was favorably impressed with the systematic management, no less than with the property of the Mt. Vernon Co. Another company, of which a Mr. Ferguson is superintendent, was preparing to resume work. One of the ledges owned by the company is well known as the American Flag, and has been opened 150 ft. by incline, along various points of which it shows a good class of ore.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Oct. 12th: A subscription has been raised in Dayton towards having 100 tons of selected ore hauled from Como to Dayton, for reduction at Birdsall & Carpenter's mill.

Wells, Fargo & Co. shipped during the past week from their offices in Gold Hill and this city, 6,037 lbs. of assayed bullion, valued at \$157,597.76.

Oct. 13th: The south shaft of the Yellow Jacket mine is now sunk to the depth of 630 ft., and it will be prosecuted with great energy 100 ft. deeper. The last hundred ft. was sunk in 27 days.

#### OREGON.

Jacksonville Sentinel, Sept. 28th: Mr. Devins has discovered a large bed of superior chalk, on Lost river, about 100 miles from this place.

Yreka Union, Oct. 5th: Quartz has been taken from a ledge on Grave Creek, Jackson county, Oregon, which yields about \$20 to the ton. If further tests will warrant it, a mill will be erected on it.

NEW HAMPSHIRE GOLD MINING.—The quartz mill which has recently been put in operation at Lebanon, N. H., cleaned up for the first week in September \$300 from ninety-six hours run, from thirty tons of ore. A pretty satisfactory result.

(Written for the Mining and Scientific Press.)

#### Letter from Kearsarge.

EDITORS PRESS: As I have not yet made my visit to Lone Pine, I will give you a few particulars from this section. The Kearsarge mill has just cleaned up over \$5,000 from 43 tons of ore, being fully 80 per cent. of the assay of the pulp made in Virginia. The ore was worked raw, in Wheeler pans, after having been put through a preparatory course of treatment by Mr. Low, the superintendent. Ore assaying \$300 per ton has been struck in the lowest works of this company's mine.

A small quantity of ore is daily packed from the mines of the Silver Sprout Company to their mill; of its quality I know nothing. The poor results formerly obtained from the Silver Sprout ores of good quality, appear to have been at least in great measure due to the system of working them then pursued, which was to grind the ore in Wheeler pans, with steam to heat the pulp, and to afterward amalgamate in Wakelee pans, the object being to avoid injury to the mercury by the severe grinding action of the Wheeler pans. The plan did no answer; on the contrary, better results can be got with Wakelee pans alone than with this combination.

As the explanation of this may be useful to some, I will give it. The silver in the ore is in a mineralized state, that is, chloride, carbonate, sulphide, etc. In order to amalgamate, it must be set free by chemical action, which is done directly or indirectly, by the iron of the pan. If the ore is put at once into Wakelee pans, with mercury, the chemical action by which the mineralized silver is brought to the metallic state, takes place in immediate contact with mercury, which takes up the released silver; for, as the sides and other parts of pans where there is no friction, are always covered with rust, or other impurities, this action is almost wholly confined to the bottom, where the mercury, in a Wakelee pan, mainly rests. But when the ore is first ground in a Wheeler pan without mercury and with heat, the reduction of the silver takes place therein, and it passes to the Wakelee pan in a metallic state, but almost infinitely divided and mixed throughout the mass of pulp, in which condition the Wakelee pan is not a sufficient good mixer to catch it. It is worse than the finest flour gold. Perhaps barrels might do better to follow grinding pans in which no mercury is used.

The amalgamation in the Silver Sprout mill is now done in the Wheeler pans, the others being used only as separators. The superintendent tells me he is getting good results. I myself purchased one ton of the Silver Sprout ore of the same quality, which worked in the manner described, yielded only \$50 or \$60 per ton. I had it conveyed to Mr. Wood's arastra and ground, and afterwards amalgamated it in a very imperfect barrel apparatus, by a process of treatment which I have found to be excellently adapted to these ores, and obtained \$128 in silver, and \$10 in gold. By this process I can get the bullion .900 fine, or even finer; but it cannot be done so well in iron pans. At some future time, I will give you the details; with these ores 80 per cent. can be obtained. It is also adapted to the milling ores of Lone Pine, of which I expect to tell you something soon. CHAS. H. AARON.

Kearsarge, Sept. 25, 1867.

A GOLDEN WEDDING.—The fiftieth anniversary of the marriage day of Lowell Mason—so well known in musical circles—was celebrated on the 3d ult., at Orange, New Jersey. Both of the bridesmaids who officiated on the original occasion, Sept. 3d, 1817, and one of the groomsmen, were present; making five out of six of the bridal party of half a century ago, who were met to celebrate that event, and to exchange recollections of the many friends who in the course of these years have passed away.

THE Government of Prussia is conducting itself in a most flatteringly friendly manner toward the United States at the present time. Especial honors have been paid to our Minister, Mr. Bancroft, and to Admiral Farragut. Recent events have not set us down much in the estimation of our big brothers on the other side of the Atlantic.

COMMODORE VANDERBILT has hailed and paid for one hundred steamships.

## Notices to Correspondents.

PONTIAC—IRON BRIDGES.—In our last week's notice on this subject, an error of a century occurred—1855 ought to have been 1755. Franklin was the party who first induced Paine to visit America, who, after taking a prominent part in the controversy and eventual contest with the mother country, settled in Philadelphia, in 1787, when it was proposed to construct a bridge over the Schuylkill without river piers, as the stream occasionally, in the spring freshets, was apt to become choked with ice. Paine holdy offered to meet the difficulty by building an iron bridge with a single arch of 400 feet span. In the same year he submitted a plan of his bridge to the Academy of Sciences, whose opinion was decidedly favorable. A copy of the design was sent to Sir Joseph Banks, in order that it might be submitted to the Royal Society. He subsequently visited the Rotherham Iron Works, Yorkshire, to have his models cast. It formed a segment of an arch of 410 feet span, composed of framed iron panels radiating toward the center in the form of vousssoirs. An American named Whiteside had advanced the projector the requisite means on the security of his (Paine's) property in the United States, which enabled him to complete the castings. When finished, the whole were forwarded to London, where they were put together on a howling green at Paddington. When completed, this bridge was visited by great numbers and landed as a success. At this critical period Paine's attention was drawn towards replying to Burke's celebrated letter on the French Revolution, which elicited from him *The Rights of Man*. Simultaneously his friend Whiteside became bankrupt, whose assignees arrested Paine, but he was liberated by two other Americans becoming bail for him; after which he became intermixed with the French Revolution, in the course of which he was imprisoned eleven months, and, by a fortunate mistake for him, evaded the guillotine. He eventually escaped to the United States, and in 1803 presented to Congress a memoir on the construction of iron bridges, accompanied by several models. From what has been stated it will be seen that owing to his political occupations he failed to finally erect his bridge. In the meantime, however, the bridge exhibited at Paddington had made a practical impression. The manufacturers agreed to take it back as part of the debt due to them, and the materials were employed in forming the noble structure which now spans the Wear at Sunderland, England, where it was erected in 1796, and was long esteemed as the greatest triumph of the art—its span being 236 feet, exceeding that of any stone arch, having a rise of only thirty-four feet, the springing commencing at ninety-five feet above the level of the river, thus allowing vessels of 300 tons burthen to sail underneath without striking their masts.

## The New Quartz Working Process on the Fremont Estate.

Passing through the Pacific Foundry, a few days since, we noticed, among other work in progress there, two of Lundgren's pulverizers and Ryerson's superheated-steam amalgamators in process of construction. This machinery is designed for use at the mines on the Fremont-Mariposa estate, now under the management of Mark Brumagin as President of the company, whose headquarters are in New York; Jacob Brumagin, agent for the estate, and Henry J. Hall, a practical and experienced quartz miner, superintendent of mills and mines. One set of this machinery has been operating, at intervals, as water could be obtained for motive power, for over a year. The working of this experimental mill was so satisfactory that a second one was put up the past summer, which is run by steam; and now we learn that two more sets are nearly ready for transportation to the same estate, which will be put up at the Benton mill, which has a capacity of sixty-four stamps, and which is now being rebuilt, to receive this machinery.

The process by which the rock is now reduced and the gold extracted from it, is called by the company the "Eureka Process, and is a process for treating the ores dry. The *modus operandi* is as follows, and was first substantially described on this coast in the MINING AND SCIENTIFIC PRESS, October 27, 1866: The rock is first crushed by rollers, stamps or any other means, which will reduce it so that it will pass through a No. 12 or 14 wire screen; it is then placed in a "Lundgren pulverizer," which consists of an iron cylinder about five feet in diameter and three feet through its axis; into this cylinder is first placed 2,400 pounds of iron balls, weighing one ounce each, and with them about 800 pounds of quartz, first reduced as above. This cylinder is then set in motion at the rate of twenty-four revolutions a minute. The mass of iron and quartz is thus mingled together, and an almost inconceivable amount of crushing and friction produced, which results in a most extraordinary pulverization of the ore. The usual time of reducing a charge is one hour, which includes the time of loading and discharging. A single machine requires from four to five-horse power to drive it, and will reduce from eight to nine tons in twenty-four hours to the fineness of superfine flour, or so fine that it will pass through a wire screen of "100"—being 10,000 meshes to the square inch. About 1,200 pounds of the quartz thus pulverized is then placed in a close, cylindrical, upright hoiler-shaped retort, or amalgamator; superheated steam is then applied for about thirty minutes, which has the effect to drive off from the particles of gold all impurities which tend to check amalgamation, and produce a partial decomposition of the finely divided sulphurets. Quicksilver is then introduced, which, by the action of the steam, is partially vaporized and violently agitated with the mass of the pulverized material containing the gold, by which means a rapid and thorough amalgamation of the quicksilver with the gold is effected; when the steam is condensed and the quicksilver, with the gold it may have taken up, thrown down, by means of cold water, applied to the upper and outer portion of the apparatus.

A small "manhole" is then opened from the under portion of the amalgamator, through which the mass of quartz, quicksilver and gold falls into a reservoir, from which it is washed by hydraulic hose into an ingeniously constructed shaking-table of copper, about twenty feet long, and supported on a wooden frame, with rifles of a peculiar formation, which gives to the water and pulp the same kind of agitation as that of the ocean surf with an undertow. As the mass falls upon the table, the amalgam, from its great weight and the peculiar ac-

tion of the table, is soon cleared from the debris and collected in rifles for removal. This amalgamator and table will work as much ore as two of the crushers can reduce to the requisite fineness. The company employing this mode of working have called it the "Eureka Process," which is in fact a combination of the Lundgren crusher with Ryerson's amalgamator and shaking-table.

With the second mill, now in operation, the present management, according to the report of the President, has crushed some 800 tons of quartz from the Josephine mine. The lowest yield, at one clean up, has been \$31 per ton; the highest, \$173—giving an average of \$43.53 per ton. In the greater portion of this quartz, says the report, not a particle of gold could be seen before crushing. The average yield of the Josephine mine, by ordinary process, has hitherto been less than \$10 per ton. It is pretty generally understood that the ore which is now being taken from the mine is better than the average of past years; but how much of the increased yield is due to the better quality of the rock, has not been determined, so far as we are aware, by any comparative experiment, such as delivering alternate car-loads to any ordinary stamp mill to be worked by the old method, and putting the balance through the "Eureka Process." It is claimed that the increased yield by the latter process is mainly attributable to the ore being pulverized dry, and kept dry until it enters the superheating steam amalgamator—no washing being allowed until the amalgamation is perfected. The gold on this estate is so fine it is estimated that not more than thirty per cent. of its assay value can be collected by the ordinary wet process. This is true to a greater or less extent with all gold-bearing quartz.

We may here add that we have understood that a few weeks since some 20 tons of rock was hauled to Bear Valley from the Princeton mine, run with the ordinary wet battery and plates, which yielded from \$14 to \$16 to the ton. At Bear Valley, where the company is using the "Eureka process," this same rock, of what is considered a fair average ore, yields \$35 per ton.

The company, as is inferred from their report, is perfectly satisfied with the results as obtained by the new process, and probably do not care to be to the cost, trouble and loss of further experiments. It is to be hoped, however, for the cause of science, and with the view of definitely satisfying the world in this important matter, that some arrangements will soon be made to institute a series of careful comparative experiments, under the joint observation of the managers of the Mariposa property and a committee of disinterested experts. The matter of comparative cost of working, as well as increase of yield, should be carefully noted. We understand that such an experiment has been recommended to the company by an experienced engineer of this city, who was recently employed to make a report upon the condition and prospects of the company's property.

Every person at all acquainted with working auriferous quartz knows that much, very much, of success depends upon the degree of fineness to which the rock is reduced, and the intimate manner in which the particles of gold contained in the pulp are brought into contact with the quicksilver; as well as the care which is employed to see that no gold or quicksilver is lost, by being washed away in the water which may be employed to aid in the process of amalgamation. The inventors of the process above described appear to give all the desirable conditions to their fullest extent, as well as avoid all possibility of loss from water, by holding everything in a close vessel until thorough amalgamation and a full concentration of the amalgam has been obtained.

If this new process is really all that it is claimed to be, we ought not to be surprised at a most extraordinary increase of yield; and we trust the management of the Mariposa estate, having, to their own satisfaction, wrought out what appears to be a most important economical problem in the working of our gold mines, will not hesitate, at the proper time and in a proper manner, to give to the world a practical demonstration of the superiority of their process. So much money has been spent upon mere theories and new processes, that people are now exceedingly slow in adopting anything novel until it has been fully understood in their own minds and practically demonstrated to their own vision.

## New Steamer for Panama Bay.

A new steamer for the use of the Pacific Mail Steamship Company, in Panama Bay, was launched on Saturday last, from the ship-yard of Henry Owens, at the Potrero. A large number of ladies and gentlemen were present at the launch, which was conducted under the immediate supervision of the company's superintending engineer, Mr. James Pollock. As her keel struck the water, she was duly christened the "Ancon" by Miss Katy Huhhard, a young miss of eleven summers, who was selected to perform that ceremony. The liberality of her builder, Mr. Owens, was displayed by the generous donation to each workman who had been engaged in her construction, of a day's wages extra, for the promptness and skill which they had displayed in hurrying up the work, which was done in an unusually short time, in order to enable her to make the passage to her port of destination before the setting in of rough weather in the Gulf of Tehautepec. The steamship company also displayed their usual liberality on the occasion, by spreading a bountiful collation of choice viands and beverages for the invited guests and workmen, in token of the company's satisfaction at the manner in which the work has been done. The name selected for this boat is the designation of a mountain peak overlooking the city of Panama, more generally known to Americans, however, by the name of Bolivar's mountain. She is to act as a steam tender in the Bay of Panama.

The boilers for this boat were built at the Miner's Foundry. They are two in number, low pressure, with eighteen flues, the direct flues being 15½ inches in diameter, and the return flues 12 inches; the grate surface 45 square feet in each boiler, with a heating surface of 1,369 square feet. They are built of the best American charcoal iron. We learn from the makers that the iron was of a very superior quality. The weight of the two boilers is about thirty-six tons, apart from their fittings. They are of the internal fire-box description, with water hot-toms; there are two furnaces in each boiler. Their length is twenty-six feet each, by nine feet in diameter; steam domes ten feet high, with the chimney passing through their centers, for the purpose of drying the steam.

STATE AGRICULTURAL FAIR—POSTPONEMENT OF AWARDS.—The committee to make awards of gold medals to the most valuable industries, which was to have met at Sacramento for awarding the same on Thursday last, have postponed their meeting until the 1st of November. This has been done probably on account of the election on the 16th inst., which it was thought might prevent some of the members attending, and also that more time was necessary to admit of exhibitors at the Fair to make statement of claims to the award of the gold medal in their respective departments. We are informed that quite a number of statements have already been received at Sacramento, and it is believed that when the committee meet to make the awards, that they will have a mass of practical information as regards the manufactures and other industries of California presented to them, the dissemination of which will prove of great benefit to the people of the Pacific coast.

Y. M. C. A.—The Young Men's Christian Association has published, in a neat pamphlet, a report of the proceedings of its last annual meeting. It consists of the annual reports, addresses by Rev. Drs. Scudder, Stone and Eells, the by-laws of the Association, etc. This Association is accomplishing much good among the young men of this city, and is eminently worthy of encouragement. The rooms of the Association are on California street, opposite the *Alta* office.

CORRECTION.—In noticing the rubber cement and paint exhibition at the State Fair, we inadvertently wrote the firm name of "Eppes & Ellery," instead of EPES & E. H. R. ELLERY, which should have been written.

**FOOTE'S PETROLEUM BURNER APPLIED TO A STEAM FIRE ENGINE.**—The utility of petroleum as a steam fuel has been still further tested in Boston, by being applied to one of the steam fire engines of that city, Eagle, No. 3, from the Amoskeag Work, was fitted up for this purpose. The form of the apparatus, as employed upon the Palos, was materially modified, to enable it to be adjusted to the steamer's furnace. The first trial took place on the 26th ult., and, according to a correspondent of the New York Times, was a complete success. Water was taken from a hydrant and forced through 400 feet of hose in half the time it would be required to have done the same by the use of coal. In working the engine there was an entire absence of the cinders and smoke which usually gives the smoke-pipe of the steam fire engine, when in operation, the appearance of a miniature volcano in most violent eruption. The feasibility of holding steam was especially noted; and it was the impression of those who ought to know that there was a large saving in expense of fuel. Chief Engineer Damrell expressed himself as highly pleased with the result of the trial, and ventured the opinion that petroleum, by the use of this apparatus, was decidedly superior to coal for use in steam fire engines, both in convenience and economy.

**BUSSEY'S BURGLAR-PROOF LOCK.**—We would call especial attention to Bussey's keyless burglar-proof lock, the advertisement of which will be found in our columns to-day. This lock attracted much attention at the late State Fair. In our notice of it last week the printer made us speak of it as the invention of W. C. Barry, instead of W. C. Bussey, as written. This lock is fast gaining the reputation as being the best and safest lock yet invented.

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. LUTT, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**JACOB SHEW, Photographer,** 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14tf

**SECRETARSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15tf

**FOR CABINET PHOTOGRAPHS, or ENAMELED CARDS,** of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v15qr

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kenny streets, makes a specialty of filling the tans of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. 5v15qr

Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler—repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14ly

**HENDY'S LATEST IMPROVED CONCENTRATORS,**

**FOR GOLD AND SILVER ORES,**

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed, is the only true and mechanical one for the purpose of concentration.

**CENTRIFUGAL FORCE AND GRAVITATION,**

Combined as they are in this machine, CANNOT FAIL TO ACCOMPLISH the object sought.

Many certificates from proprietors of mills, who have this Concentrator in use, can be had, if required, giving the most flattering accounts of its efficiency. A most substantial evidence of its worth is the fact that the proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

**Directions for Operating Hendy's Concentrators:**

- FIRST—Set the Pan, A, level, by its inner rim.
- SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
- THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

**References:**

- Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:
- EMPIRE MILL (6 Concentrators).....Grass Valley, Nevada County.
  - NORTH STAR M. & M. CO. (4 Concentrators).....Grass Valley, Nevada County.

  - MOREY & SPERRY (1 Concentrator).....New York.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co., }  
VIRGINIA CITY, Nev., Sept. 17, 1867. }

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, JR.

The bill was presented in accordance with the above request, and duly paid.

**CAUTION.**

All of HENDY'S PATENT CONCENTRATORS are marked thus:  
"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,  
**JOSHUA HENDY, Patentee,**  
Union or Fulton Foundry, San Francisco.

OFFICE IN THE BUILDING OF THE  
CALIFORNIA SAVINGS BANK, California  
street, one door from Sanson street.  
FIRE AND MARINE INSURANCE. 10v14qr

**Perry Davis' Vegetable Pain Killer.**

This medicine has relieved more pain, and caused more relief than any other one thing that can be named. It is a "balm for every wound." Our first physicians use it, and recommend its use; the apothecary finds it the first among the medicines called for, and the wholesale druggist considers it the leading article of his trade. All the dealers in medicine speak alike in its favor, and its reputation as a medicine of great merit and virtue is fully and permanently established, and it is the "Great Family Medicine of the Age."

Prices, 25 cents, 50 cents, and \$1 per bottle.

Sold by All Druggists, Grocers and Medicine Dealers everywhere. 15v15-1m

LEWIS FALKENAU. HENRY G. HANKS.

ENERGETIC MEN OR WOMEN CAN MAKE MONEY in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v15qr5p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

**HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW** prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Oil-Oil Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Oearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. FRESOTT. IRVING M. SCOTT  
24v12

OHIO has just now two mining excitements; one is a gold mine discovered in Richland county, the other a silver discovery in Washington county. The former locality has been visited by a Cincinnati scientist who reports extensive deposits of gold ore, the best specimens being found near Bellville on the borders of West Virginia.

**A BIG CONTRACT.**—Hon. Oakes Ames, of North Easton, Mass., has contracted to build nearly the whole of the remaining portion of the Union Pacific Railroad—some 600 miles, passing through the Rocky Mountain region—receiving therefor over \$47,000,000. This is the largest private contract ever made.

**EXTRAORDINARY COINCIDENCES.**—The diameter of the earth, multiplied by 108, gives the diameter of the sun; the diameter of the sun, multiplied by 108, gives the mean distance of the earth from the sun; and the diameter of the moon, multiplied by 108, gives the mean distance of the moon from the earth.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.  
25v12-3m

**DECLINE OF SKILL IN BUILDING OPERATIVES.**—Where are now the bricklayers who could build walls which, for neat and strong work, are in these days still a delight to look at? the stone masons who could select stone which, fifty years after the completion of the edifice, exhibited in many cases as clean work as the day it was done, and which will still endure for years without either the process of triennial cleaning down, or covering over with five or six coats of paint? the carpenters, with their joists, roof and flooring adapted to all requirements, without the addition of iron work, to render small scantlings efficient for the duty of proper ones; the carvers of all kinds, yet putting to shame all our modern make-believe attempts in competition and papier maché? the plasterers, with their ornamental work, executed by hand, on the wall or ceiling itself, rendering the modern "decorator" a man of no consequence? These were all art workmen, and truly so, and we shall not have them again until the building trade, leaving the control of one man, who undertakes all trades "by contract," shall again be carried out by the master workman, with his assistants, as formerly practiced. It is thus only the best work is performed, even in the present day, in England, and by all trades in foreign countries.—*The Builder.*

Mr. VIOLINS, the greatest wine merchant of England, is dead. He was a sportsman; never had but one sort of wine in his cellar; never kept a clerk; never sent in a bill; never was in London, and never rode on a railway.

**Assayer and Chemist.**

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office. 3v15ct

M. S. WHITING, F. G. BERRY.

**WHITING & BERRY.**

No. 609 Sacramento street, two doors above Montgomery, SAN FRANCISCO.

**TEA, WINE AND SPIRIT MERCHANTS,**

IMPORTERS AND WHOLESALE DEALERS IN FINE Brandy, Whiskies, Gins, Port, Sherry and Champagne Wines, Ale, Porter, Cider, Bitters, Cordials, Syrups, etc. for medicinal and family use, and suppliers to families, apothecaries, physicians, elite and country dealers, hotels, clubs, etc. in large or small quantities. (Observe from name on each cork and fac simile of signature on label. Trade mark registered.)

This is the only exclusive Tea, Wine and Spirit Store on the Pacific coast. It is neither a saloon nor simple room (as no wines or spirits are allowed to be drunk on the premises); but a depot where selected Teas and Pure Wines and Spirits may be found, at wholesale and retail, for medicinal and family use. In this respect it is our aim to vie with Bininger & Co., of New York, Biglow & Davis, of London, and Cozzens & Co., of Washington, where every facility is offered to ladies, as well as to gentlemen, in making their own selections and purchases in quantities to suit. Our Treatise on Wines, Spirits and Teas may be had at our depot gratis, and will be mailed to consumers and dealers in the interior when requested. WHITING & BERRY, 609 Sacramento street, 2d door from Montgomery, San Francisco. 14v15

**Piles! Piles! Piles!**

NOT PILES OF GOLD, NOR YET OF SILVER, SO much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

**WOOD'S SUB-POSITORY.**

It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. The SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it if you are troubled with the Piles—you will not be deceived in it.

Sold wholesale and retail by J. H. REDINGTON & CO., Nos. 416 and 418 Front street; GEO. ORISWOLD, corner of Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Bush street, between Montgomery and Kearny. C. WOOD, Proprietor, No. 63 Tehama street, between First and Second. 24v14-3

**THE PACIFIC IRON WORKS,**

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greeno Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Brynn Battery, Vurney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

**FIRST**

**Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture, sell and use

Ellery's Patent India Rubber Cement & Paint. It is for all exposed surfaces; impervious to wet; will not peel, blister or crack, in any climate. Superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Allant Lead Works use our Paint only.

NEW CLOTH ROOFS put on cupolas and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—eight dollars per hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., Dr. A. Oliver, etc., and the wood work of Sheriff Davis' building, 88 feet front, on Fremont street, between Third and Fourth streets—only one cent. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

EPES & E. H. R. ELLERY are now prepared to make good roofs and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Cement. No asphaltum or coal tar used. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

**International Hotel,**

JACKSON STREET,

BETWEEN MONTGOMERY AND KEARNY STS.,

SAN FRANCISCO, CAL.

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND OHINA. LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days. On the 10th, 19th and 30th of each month that has 31 days. When the 10th, 19th and 30th fall on Sunday, they will leave on Monday following. Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco. Departures of 19th or 19th connect with French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America. Departure of 10th connects with English steamer for Southampton and South America, and P. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates as given below: October 10th—MONTANA, Capt. E. S. Farnsworth, Connecting with HENRY CHAUNCEY, Capt. Gray. October 19th—GOLDEN CITY, Capt. W. F. Lapidge, Connecting with the RISING STAR, Capt. Comer. October 30th—SACRAMENTO, Capt. Parker, Connecting with ARIZONA, Capt. Maury. Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attend ance free. These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock. Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England. For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO. The Steamship CHINA, Capt. E. W. Smith, will be dispatched October 14th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI. For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets. OLIVER ELDRIDGE, Agent.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics a paper of inestimable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Frederick Union.

Metallurgy.

BOALT & STETEFELD'T, Metallurgists and Mining Engineers AUSTIN, NEVADA. Western Branch of ADELBERG & RAYMOND, No. 90 Broadway, New York. 11v11

G. W. MAYNARD. J. H. TIEMANN. MAYNARD & TIEMANN, Mining Engineers and Metallurgists, 240 Pearl street, New York, —AND— CENTRAL CITY, COLORADO. 19v12-ly

G. W. STRONG, ASSAYER AND WORKER OF ORES, SAN FRANCISCO FOUNDRY, Fremont street, near Mission, San Francisco. 14v15qr.

JOHN TAYLOR & CO. IMPORTERS, AND DEALERS IN ASSAYERS' MATERIALS, Druggists' & Chemists' Glassware, Photographic Stock, Etc. 512 and 514 Washington Street, SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERT LINO (London) and BEEKER & SONS (Antwerp, Belgium) their superior ASSAY AND BULLION BALANCES, And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.

MOSHEIMER'S PIONEER MINING SCHOOL —AND— Metallurgical Works. Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1. Assaying of ores, metals and other mineral substances. 2. Technology, or Chemistry, as applied to any special branch of manufacturing. 3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5. Concentration. Dressing of ores. 6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology.

My lately invented Roasting Furnace has the following advantages: A Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$340. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$5. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas or quicksilver when amalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores.....\$3 00 Copper ores..... 5 00

Office, No. 328 Montgomery street, San Francisco, Cal. 6v15-3ms

ENLARGEMENT OF THE American Journal of Mining Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to Twenty Pages, Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral Interests of America, containing beautiful engravings, illustrating the latest improvements in mining, milling and metallurgical machinery. The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America. The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, WESTERN & COMPANY, Publishers, 37 Park Row, N. Y. Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices. DEWEY & CO., Patent Agents, Publishers and Job Printers, 505 Clay St.

A Word to Readers in the Atlantic States.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance moneys upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into. Jan. 1, 1867.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1867, an assessment (No. 24) of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine. Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. oct14

Old Colony Silver Mining Company.—Location of Works: Austin, Reese River, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of September, 1867, an assessment of three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 523 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the second day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY O. HOWARD, Secretary. Office, 523 Montgomery street, San Francisco. oct5

Great Central Mining Company.—Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of September, 1867, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, or at the Pacific Bank. Any stock upon which said assessment shall remain unpaid on the twenty-third day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary. Office, No. 302 Montgomery street. oct5

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

Hope Gravel Mining Company.—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of September, 1867, an assessment (No. 17) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 533 Kearny street, San Francisco. Any stock upon which said assessment shall remain unpaid on the sixth day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. oct21

Oxford Betn Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1867, an assessment (No. 24) of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine. Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. oct14

Old Colony Silver Mining Company.—Location of Works: Austin, Reese River, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of September, 1867, an assessment of three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 523 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the second day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY O. HOWARD, Secretary. Office, 523 Montgomery street, San Francisco. oct5

Sophia Consolidated Gold and Silver Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of September, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at No. 641 Washington street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the twenty-third day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the seventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID E. JOSEPH, Secretary. Office, 641 Washington street, San Francisco. sept28

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo County, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the sixth day of August, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with 4 columns: Name, No. Certificate, No. Shares, Amount. Lists names like F. H. Aberding, F. H. Aberding, etc.

And in accordance with law, and an order of the Board of Trustees, made on the sixth day of August, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Thursday, the twenty-sixth day of September, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary. Office, 408 California street, San Francisco. oct4

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired. This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed. Mill men are invited to examine these pans and sellers for themselves, at the PACIFIC FOUNDRY, San Francisco.

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS For Steam Engines.

Giffard's Injectors, For Feeding Boilers.

STODDART'S IRON WORKS, Beale Street, San Francisco, 23 1/2 St

PATTINSON'S HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. THOMAS PATTINSON.

Hunt's Double-Action Pump

Is cheap, durable, strong, and not liable to get out of order Built and on hand at No. 23 Second street, and 103 Jessie street 17v15fr E. O. HUNT, Prop'r.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO., Pacific Iron Works, 9v15fr

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

— or —

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077 8v13fr SAN FRANCISCO.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms: No. 1—10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600 No. 2—12-inch Crusher, capable of similarly crushing through five to six tons per hour, price, \$850 No. 3—18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, price, \$1,200

EXPLANATION OF THE ABOVE SPECIFICATIONS. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Baywide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county: RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866. JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERENCES.—E. Stockton, Folsom; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. E. McMillan, Lexington, Santa Clara County. For Circulars, etc.

Boilers and Machinery,

CASTINGS OF ALL KINDS,

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency. 12v15qr

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for many purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed. A small needle, bent at the point and fixed in a holder, may be occasionally required to clean the main jet through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower plate to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off; the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v14-3m-8

Notice to Miners,

Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-ly Stove Store, No. 125 Clay street, below Davis.

DR. BEERS' PATENT

WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to crush the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15 6m

NELSON & DOBLE,

AGENTS FOR Thomas Firth & Sons' Cast Steel Files, Etc., Shear, Spring, German, Plow, Bilster and Toe Calk Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, San Francisco. 10v14qr

ASPHALTUM

For sale in any quantity to suit, by the

Pacific Asphaltum Company,

No. 533 Kearny street, corner Sacramento, San Francisco.

This Asphaltum is the purest to be found in the market, being free from rock and clay, or other impurities. Sidewalks laid and Roofing done at shortest notice.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

INDIA RUBBER AND ITS USES.—The employment of india rubber or gutta percha, as it is called, in the arts and manufactures, is rapidly increasing. From the time that sulphur was first discovered as an ingredient for hardening the gum, it has been the study of artists and inventors to combine and utilize this article in the objects of their conceptions. Before, however, the hardening process was discovered, the product was principally confined to over-shoes; but now not only hoots and shoes are made, but almost every article of clothing, hats, coats, pants, vests, hoots, collars, cravats and gloves, until the outside is truly an india rubber man walking fearlessly in the pelting storm.

Even the horse is made a recipient of this discovery, and humanity has found the means to clothe the beast and protect his sleek coat from the storms of winter, by a covering made of this useful gum.

The government has lent its aid and patronage in the use of many articles made of rubber, and now forwards important documents through the tropics and across the oceans in envelopes manufactured from gutta percha, made water-tight and impervious to moisture.

The elephant is no longer laid under tribute to give up his shiny tusks, their use having been almost entirely superseded by rubber in the manufacture of combs. Ornaments and toys are extensively made of this article, and almost everything in the arts and trades for the use of man and the amusement of children, is incorporated with it, and which would fill a long catalogue to enumerate.

The New York Rubber Company, of which Mr. Joseph Fraser, of this city, is the gentlemanly agent, have published a long list of articles manufactured by them, and to which they are making constant additions, being determined to keep pace with the increasing wants of the people. As illustrative of the above article, a perusal of their catalogue would be very instructive to all.

A REMARKABLE SPRING.—Much has been said and written about a remarkable spring, reported to exist at Gettysburg, in the immediate neighborhood of the locality where the great battle was fought. The existence of this spring has long been known to the residents of that vicinity, and by many believed to possess wonderful healing properties. Even the traditions of the Indians have ascribed to it the power of prolonging life and curing disease; but as it has no uncommon taste, and has the appearance simply of very pure water, the accounts of its medicinal qualities have generally been considered fabulous and imaginary. The effects which it was known to sometimes produce upon the healthy human system, were even regarded as evidences of its unfitness for domestic purposes.

Immediately after the preliminary battle on the 1st of July, several of the wounded dragged themselves to this spring, merely to satisfy the ordinary cravings of thirst; its peculiarly invigorating and life-sustaining influence at that time, struck many with marked surprise, and caused much talk at the time; which appears to have finally attracted the attention of some scientific gentlemen, who immediately instituted a thorough analysis of its waters. This analysis, it is said, developed the fact that it did possess most remarkable properties—in fact that it is one of the most remarkable medicinal springs known in the world.

Its peculiar properties are due to the lithia which it contains, in solution, and which is found in no other spring on this continent. Lithia is a recently discovered alkaline substance found in certain minerals, especially in petalite. It is the basis of the metal lithium, and is known to possess very remarkable medicinal qualities. The account of the wonderful properties of this spring, it is said, have recently been quite fully verified by medical testimony, and the sick, the lame, the halt and the blind in great numbers, have sought and found relief at this modern fountain of health, during the last two or three years. The Board of Health of the city of New York, according to the New York Evening Post, have become so impressed with its value, that they are about making experiments to more fully determine its value.

NICHOLSON, the owner of the patent for the wooden block pavement, has obtained judgment against Chicago for \$30,000, for the unauthorized use of his pavement.

OF INTEREST TO QUARTZ MINERS.—In cleaning up in quartz mills, says the Alta, a lot of scraps of iron are always found, consisting of fragments from shoes, dies, shovels, picks, hammers and drills; and these lumps are knocked about in the mortar till numerous particles of gold are driven into their interstices.

MORE GOLD DISCOVERIES IN NORTH CAROLINA.—Two more gold mines have been discovered in Rowan county, North Carolina. Several specimens of quartz ore, exhibited to the editor of the Salisbury Banner, were speckled with the yellow ore, many of the little particles being half as large as a grain of wheat.

CALIFORNIA WINE FOR THE EAST.—Mr. Bruckman, of Stockton, has just shipped one thousand four hundred gallons of wine to parties in New York. This wine was the product of a vineyard near Chinese Camp, Teholmne county, and was said to be a very fine article.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

THE SEVENTEENTH ANNUAL SESSION of this College will commence on August 28, 1867.

TERMS.—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Lights, Baths, etc., per session of ten months, \$350.

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschl, St. Ignatius College, Market street, San Francisco.

**CALIFORNIA SHIPMENTS.**—It is mentioned, as an important and suggestive fact, by the San Francisco financial correspondent of the Sacramento Union, that we have at this time about seventy large ships "traversing every sea," laden with wheat and flour from this port, the aggregate cargoes of which exceed five millions bushels of the former, and 100,000 barrels of the latter; with a fleet of nearly thirty ships now loading or waiting to load, which will take nearly another million bushels of wheat, besides a large quantity of flour! It is also stated by the same correspondent that the extent of our grain shipments, at the present time, is seriously affected by the lack of wharf accommodations for loading—vessels having to wait in the stream for their "turn" at a proper berth for loading. These are important facts with regard to the commercial progress of this city.

**ELI TAYLOR—WHO KNOWS OF HIM?**—We have before us a letter addressed to "Eli Taylor, Esq., California." Said letter has been written in behalf of the family of said Taylor, by a nephew, named W. H. Bayne, of Washington, D. C. It would appear from the letter before us that Mr. Taylor has been in California quite a number of years, and his friends are especially anxious to hear from him if alive, or of him if dead. Any person knowing of him will confer a favor on an afflicted family by addressing a line to this office.

**THE MONTGOMERY STREET EXTENSION** has received its quietus at the hands of our excellent Mayor Coon. The resolution for its extension was vetoed at the last meeting of the Supervisors—the Mayor giving his reasons in a concise and comprehensive manner.

**To the People  
Of the Pacific States,  
And Especially those Engaged in Mining.**

Gold is the attractive element which has brought more than half a million people to this coast. Every one who comes here wishes to have his share out of Nature's treasure box as quick as possible. The laws of the land are liberal. They say you are welcome to all the gold you can find or dig out, and it depends only on you to know or to learn how to do it.

That our mines are rich beyond calculation, is plainly proven by the thirty millions of gold we annually produce, and which is still on the increase, in spite of the many failures and the imperfect mode of working, by which more than fifty per cent of the precious metals is lost.

The days of placer mining—where only physical strength was required—are gone, and we have now to resort to Practical Chemistry and Metallurgy for working the ores of our mines. Not every miner can be a Chemist and Metallurgist, as such an acquirement requires years of study; but what they want, and what pretty effectually meets the case, is a place where, in a few lessons, they can obtain a practical knowledge of how to treat certain classes of ore; and for this purpose, to make mining in the future more reliable, safe and profitable. With this end in view, I have endeavored to bring within the reach of every one the necessary practical knowledge of how to be successful in mining; and for this purpose I have now established the first and only Practical METALLURGICAL AND MINING SCHOOL in the United States, where gentlemen can learn more in a few practical lessons than by years of book study without practice.

I have also the only METALLURGICAL WORKS in California, where I undertake to assay and work ores of every description.

Many eminent gentlemen have, within the past year, taken lessons and graduated from my establishment, and all of them will bear testimony that they were perfectly satisfied with the amount of information they obtained, and that it was so obtained in half the time they expected.

For further particulars apply at my office, 325 Montgomery street, San Francisco.

**EXCELSIOR**

**Double-Acting Suction and Force Pump.**

Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

By simply loosening the nut seen at the base of the Air-Chamber, the discharge nozzle may be turned, thus making a right or left-hand Pump.

Fig. 4.

Fig. 3 represents a Hand Pump, which works very easy, and with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable honnet of the valve chest.

**IN THE PROBATE COURT OF THE CITY AND COUNTY of San Francisco, State of California**—In the matter of the Estate of **HENRY GANABL**, deceased. Order to show cause why Order of Sale of Real Estate should not be made. It appearing to the said Court, by the petition this day presented and filed by Andrew D. Smith, the Administrator of the Estate of Henry Ganabl, deceased, praying for an order of sale of real estate, that it is necessary to sell the whole of the real estate to pay the debts, expenses and charges of the administration of said estate. It is therefore ordered by the said Court, that all persons interested in the estate of said deceased, appear before the said Probate Court on **MONDAY**, the eighteenth day of November, A. D. 1867, at ten o'clock in the forenoon of said day, at the Court Room of said Probate Court, at the City Hall, in the City and County of San Francisco, to show cause why an order should not be granted to the said Administrator to sell so much of the real estate of the said deceased as shall be necessary. And that a copy of this order be published at least four successive weeks in the Mining and Scientific Press, a newspaper printed and published in said City and County. **M. C. BLAKE, Probate Judge.**  
Dated October 17th, A. D. 1867. 16v15-5w

**NOTICE TO CREDITORS.**—IN THE PROBATE Court of the City and County of San Francisco, State of California. Estate of **HENRY GANABL**, deceased. Notice is hereby given by the undersigned, Administrator of the above named estate, to the creditors of, and all persons having claims against said deceased, to exhibit the same, with the necessary vouchers, within ten months from the first publication of this notice, to the undersigned, at his office, No. 33 Court Block, 636 Clay street, San Francisco. Dated October 3d, 1867. **ANDREW O. SMITH,** Administrator of the Estate of Henry Ganabl, deceased. 16v15-4w

**FARMERS' AND MECHANICS'  
BANK OF SAVINGS.**

comprehend the unphilosophical nature of the principle on which this device works, as applied to the purpose intended, if it will look at it simply in the light of a rotating pendulum, which it is—that and nothing more.

The defects of this contrivance were early seen, and many attempts have been made to remedy them by producing a more direct action on the throttle-valve. One very sen-

England, which consisted of an upright spindle, upon which was wound a spiral feather. A single ball was so attached to the spindle as to slide up and down, while it turned upon its axis at the same time. To the ball was fixed a kind of propeller wheel, which, by its impingement on the air, would lift the ball when the speed of its revolution was materially increased. It may readily be conceived how a lever at-

easily sustained at one point as another—most desirable arrangement, and which cannot be attained by any possible arrangement of the ordinary ball governor.

This invention has been very properly termed an "hydraulic governor," from the fact of the power being obtained by a spiral-bladed wheel, resembling a screw propeller, of which Fig. 3 is a detached view, rotating in oil contained in the cylinder, shown arranged above the valve in the principal figure. It will be seen that the principle of this device is something like that already noticed as patented by Mr. Hicks; but in its detail altogether superior. This propeller is affixed upon the central vertical shaft, and by its rotation in the oil, a direct-acting motive power is obtained for raising the lever which connects with the vertical shaft at its upper terminus. The lower end of the said shaft works in a long bearing or step within the base of the cylinder, at which place, connecting the interior of the cylinder with the space beneath the shaft, there is an opening, more or less closed by turning a cock (not, however, seen in the illustration). By this device, any degree of sensitiveness in the governor can be obtained, so much so that by its use it is said that an engine will run no faster with a steam pressure of seventy pounds than when only thirty pounds is indicated.

The horizontal driving-shaft is connected by a series of gears, as seen in the principal figure, with the vertical propeller-shaft; and as it is set in motion in the usual way from the main shaft of the engine, the propeller mounts upward in the oil, and of necessity raising the vertical shaft, the upper lever, and the valve-lever therewith connected by the long brass rod seen on the left of the figure. The most trifling variation in the velocity is followed by an immediate movement of the valve; and, as the case may be, it either allows more or less steam to pass. Fig. 2 represents the kind of valve employed; and Fig. 4 represents the cap and follower of the stuffing-box of the valve-spindle.

It will be readily seen that in the mechanism of Mr. Huntton's invention the weight is readily sustained with the same velocity at one altitude as at another, necessarily causing the engine to which this governor is attached to run at a uniform speed.

This invention has received much attention from the leading mechanical minds at the East, who have expressed themselves in terms of the highest approbation of its performance.

It is almost unnecessary to allude to the benefits obtained in point of economy by the Huntton governor after the preceding discovery, for it is evident at once that it is a steam-saver.

The patent, which was granted December 4, 1866, to Reuben K. Huntton, of Boston, Mass., is the property of the inventor and Mr. J. Augustus Lynch, of the same city. Their office is at No. 62 Kilby street. They will correspond with any parties addressing them. The invention was first illustrated and described in the *American Artisan* of April 17th, 1867.

## Steam Cut-off Movements.

Among the many inventions relating to steam as a motive power, those having for their object the regulation of the steam to the varying amount of work to be done, are not the least important. If the load on an engine be materially lightened, the supply of steam must be immediately reduced, or the speed of the engine may be dangerously increased. For some purposes, an engine may be regulated by the attendant workman. In general, however, the proper manipulation of the throttle-valve is impracticable with any degree of vigilance and skill which could be expected from the attendant. Hence, before the steam engine could be successfully employed in those cases where great uniformity of velocity was required, it was necessary that means should be devised for enabling the engine itself to properly manipulate its valve, without any care whatever from the attendant workman. Various devices have been contrived for this purpose. The conical pendulum was the earliest, and is still the one most universally employed. The disadvantages of this mode of regulating the supply of steam to an engine is, however, universally acknowledged. They are quite as apt to be themselves controlled by the steam, as to perform the office of "regulators"—in such cases becoming mere weathercocks, instead of acting as "governors."

It must be evident to every engineer that any ordinary ball or centrifugal device for the purpose under consideration, requires a greater speed to maintain the balls, flying from the center as they rotate at an angle of 45°, than when sustained at an angle of 60°; hence the engine must run at a high speed, in order that the valve shall be partly closed. Therefore, while there is comparatively little work to be done, the engine must run fast enough to insure the balls flying asunder sufficiently to partly close the valve. Now, in the event of some resistance being brought to bear upon the engine, and the speed being thereby to some extent checked, the balls necessarily approach each other, and the engine, while the resistance remains, must continue to run slower, that the valve may be sufficiently open to allow the necessary steam to pass which is required to overcome the resistance. No mechanical mind can fail to

sitive device employed was a cylindrical bellows, worked by the engine, and furnished by an orifice cock, which would exhaust a given amount of air, proportioned to the desired rate of speed. It is evident that if this speed should be increased, the top or floating part of the bellows would rise; hence, if a vertical rod should be attached thereto, connected by a lever with the throttle-valve, a very sensitive governor would be obtained.

Another plan for a governor was devised some years ago by a Mr. Hicks, of Bolton,

attachment could be thus brought to bear very directly upon the throttle-valve.

Each of these devices, and particularly the latter, would seem to be superior in principle to the use of the ordinary ball governor. A still better device than either seems to be a still later invention of Mr. R. K. Huntton, of Boston, an illustration of which is given herewith. In this, as well as in the two other devices previously noticed, the centrifugal or ball principle is entirely abandoned, the weight being raised in a vertical line, and the valve lever as

HUNTON'S PATENT GOVERNOR FOR STEAM ENGINES.

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California

## THE IRON AND STEEL OF THE EXPOSITION.

In proposing to make the iron and steel of the Exposition the subject of a letter, I did not think sufficiently of what was before me. It is almost impossible to see, much less possible to describe, all that is shown in this department. Nearly every country has sent something that claims attention, and Great Britain, France, Prussia, Austria and Russia make overwhelming displays of iron in all its stages of manufacture, from the rough ore to the pig of all grades; bar and plate iron; steel in ingots, bars, or rolled out or drawn into wire. Each iron producing country seems to vie with every other in the exhibition of the strength and fiber of its wrought iron and steel. Cases upon cases are filled up with bars of various sizes that have been bent, twisted and broken so as to display the grain to the best advantage. I should weary you with dry details if I attempted to describe these specimens. It is sufficient to say, once for all, that wrought iron rods and bars and railway axles have been tortured and twisted into every imaginable shape. Great round bars as thick as a man's leg are tied into knots; railway iron is twisted until it looks like a long screw, and all without a crack or parting a fiber.

It is a satisfaction to know that the scientific and practical discussion of this subject has fallen into the hands of Mr. A. S. Hewitt, of New York, one of the commissioners, who has a very complete and valuable report in preparation for our government.

In the exhibition of ores, Sweden takes the lead, not only in bulk of specimens, but in the richness and purity of the ore. Prussia exhibits a splendid suite of evenly trimmed specimens of the various kinds of ore used, chiefly brown iron ore and spathic iron (the carbonate). The United States, though not by any means fully represented in this department, has a very creditable display for variety, and for purity and practical value. There are some large masses from the Iron Mountain of Missouri, and some from Lake Superior, and a few masses of the magnetic and specular ores of Northern New York. The specular ore of Sierra county in our State, is also found in the exhibition, and it is as pure and excellent in quality as any. The Peninsular Iron Co., of Detroit, Michigan, sends a suite of specimens of Lake Superior charcoal pig iron, No. 1 suitable for foundry purposes; No. 2 rolling mill iron; No. 3 car wheel iron; No. 4 mottled, for malleable purposes; No. 5 valuable for making malleable iron, and for rolling mill purposes.

The Franklinite ore and metal is shown in connection with the zinc ores and products of the New Jersey Zinc Co. The hard white iron made from this ore has already been imported and used in California by the Union Works.

## SWEDISH IRON.

Sweden sent samples of her magnetic ores in such masses that some had to be left in the yard. They are about three feet long, and must weigh a ton or two each. I counted ten of these, and there is, in addition, in the machine gallery, a grand pyramidal stack of iron and steel bars standing upon a foundation of blocks of ore from the various Swedish mines. The various pig irons are arranged in a tier just above the ore, and above this tier the steel and iron bars of all sizes and shapes are stacked up. The iron ores received the gold medal, the steel has a silver medal, and the iron a bronze medal.

Messrs. Park and Brother, of the Black Diamond Steel Works, Pittsburgh, Pa., make a fine exhibition of cast steel in bars, round, octagonal and flat, made at their works. It is accompanied by beautifully finished edge tools made from their steel.

## KRUPP'S STEEL.

But the most extensive, and probably the most costly display by any individual in the whole exhibition, is the array of steel, raw and manufactured, sent by F. Krupp, of Essen, Rhenish Prussia. The jury have awarded him the grand prize. Krupp's works and manufactures are world renowned, and I have obtained some statistical data in regard to them, which may be interesting.

The establishment has been in existence for the last forty years, and has been gradually developing and increasing, until at the present time, the works cover continuously a surface of about 450 acres (English), 200 of which are under roof. In these works 8,000 men are employed, in addition to 2,000 more

at the blast furnaces, and iron pits on the Rhine and in Nassau. These works produced in 1866, manufactures of steel of the aggregate weight of 61,000 tons by means of 412 smelting, reverberatory and cementing furnaces, 195 steam engines, from two to 1,000-horse power each, 49 steam hammers, 110 forges, 318 lathes, 111 planing machines, 61 cutting and shaping machines, and many others of less consequence. No less than 120 steam boilers are required to keep the engines in operation, and they evaporate 150,000 cubic feet of water in 24 hours.

The yearly production is valued at over \$7,500,000, and the various objects manufactured are distributed all over the world.

The representation in Paris consists of some twenty or thirty large objects, of which the most prominent is a cylindrical cast steel ingot weighing forty tons, fifty-six inches in diameter, and standing nearly 12 feet high. It is forged at one end into an octagonal shape, and is intended for a marine crank shaft. This huge block of crucible steel is the largest that has yet been made. In the first London Exhibition a block of 2½ tons weight, was regarded with wonder, and received the only Council medal in the department of steel products. At the former Paris Exhibition a block of five tons was shown, and to the London Exhibition of 1862 one of 20 tons was sent. This shows the rapid progress made in the scale of Krupp's operations with large masses of steel. The upper end of this monster ingot of forty tons is broken across so as to show the grain. One-half of this broken surface has been ground down and polished as bright as a mirror, without developing the least defect or flaw. Not content with this proof of the density and uniformity of the ingot, they have cut a gash in the side about half way up, and have taken out a chip about as large as one man can lift, and have polished it with satisfactory results. [The production of such large masses of entirely homogeneous steel is the great achievement of Krupp, equaled only by his handling and forging the ingots into the various objects for which they are designed.] To shape this great ingot a hammer weighing fifty tons is used. All the cast steel productions of the establishment, with the exception of disk centers for car wheels, are made from ingots of a greater or lesser weight, and with a round or square section.

The large ingot stands upon a semi-circular platform, and serves as a center piece for a group of pieces of shafting, highly wrought, for locomotive wheels and tires, for guns and gun carriages, and many other objects of wrought and unwrought steel. Opposite all this is the monster gun, also made of cast steel, and weighing fifty tons. It is intended for coast defence against the attacks of iron clads. It consists of an inner tube upon which are shrunk cast steel rings, which were made like railway tires and without welding. The diameter of the bore is fourteen inches, and as it is a breech loader, the perfection of the bore and rifling may be seen by looking through the gun at the muzzle. It has forty rifle grooves. This gun was in process of manufacture day and night for sixteen months without interruption. The railways had no cars strong enough to transport it to the Exposition, so the establishment was obliged to construct its own car, which was made entirely of cast steel, and has twelve wheels. It weighs twenty-four tons. The gun is for sale, and will cost only \$108,750.

Cast steel railway tires form a very considerable portion of the manufacture of this establishment. They make about 40,000 a year, over a third of which are for English, Indian and American railways. They are made out of one piece of steel without welding, and in the following manner: Large ingots are forged out into flat lengths, from which are cut rectangular pieces corresponding with the height of the proposed tire. These pieces are then split down the center to within a certain distance of each end, wedges are inserted, the slit opened out, so that the bar is gradually, under the hammers, converted into a ring, which is at last formed into a tire between powerful rollers.

Among the many other objects worthy of note, are the "angle rings" for steam boilers. These are made after the same method as the tires, and are very perfect specimens of machine forging. One, with a diameter of ninety-six inches, weighs 483 pounds. They are sold at the works at 225 francs per 100 kilos, and any size will be made to order. Cast steel railway bars are also one of the chief objects of manufacture of the works. They are made from steel of second quality, and are afforded at a comparatively low price, about half as much more as the cost of an iron rail. The durability is greatly superior. Krupp can now supply such rails at forty francs the kilog, but I have heard that there is a new process by which the cost is to be much reduced.

## BOCHUM CO.—STEEL PRODUCTS.

Next to the exhibition of Krupp, which may be styled as princely, the display made by the Bochum Co., of Westphalia, Prussia, has most interested me. This company also make large objects of cast steel, and exhibit railway tires, shafts, axles, and some remarkably large hells, one of which is nearly ten feet in diameter, and weighs 14,750 kilogrammes. One of the most striking objects is a string of railway car wheels, twenty-two in number, all cast together at one operation, the junction being from hub to hub, and by one single connecting sprue at the bottom. When they are taken out of the sand, they are centered and mounted in a lathe as one piece, and then turned up on the edges.

It is claimed by this company that its cast steel wheels will run on an average 57,000 kilometres without requiring any repair. One of the railway companies certifies that the puddled steel tires suffer a wear of one-sixteenth of an inch in running 12,000 kilometres, while the cast steel wheels of Bochum Co. will run 39,248 kilometres before they are worn to an equal extent. It would be interesting to know how they compare with our chilled face car wheels. I have not seen any of this kind of manufacture in the Exhibition.

The French exhibit of iron and steel is very fine. Their largest steel ingot, however, weighs only 25,000 kilogrammes. It is broken across and shows a very homogeneous fracture. Some of their cast steel tires made without welding upon Krupp's method are twelve feet in diameter. A cast steel cannon weighs sixteen tons, and is turned up and polished all over. They show sheets of rolled cast steel that are twenty-two feet long six feet wide, and half an inch thick.

## ACCURATE GAUGES.

In the display of ordnance and munitions of war made by Whitworth, of England, there are some very interesting longitudinal sections of guns and rifles which show the remarkable perfection of the bore and rifling. This distinguished mechanic is known to produce some of the most accurate of gauges, and a few specimens are shown to illustrate them. A stout steel ring is handed to you through which you can pass a polished steel cylinder about half an inch in diameter. The fit is so perfect that it requires a little pressure to pass the cylinder through from end to end, and this pressure must be applied in the line of the axis, the least pressure upon the sides of the ring appears to bind upon the cylinder. You next take a second cylinder, apparently exactly the same size as the first. This passes through the ring with perfect ease, and, compared with the other, it is a very loose fit. Now the difference in diameter of these two cylinders is the 5-1000th part of an inch. Two perfectly plane surfaces of cast steel are shown. One of these slides about over the other upon a thin film or cushion of air. If by a little effort the air is excluded, the plates are inseparable by a direct pull. One may be lifted by the other.

## FORGED IRON.

In forged iron, for ornamental and decorative purposes, the exposition is very rich. There is a long line of gates and sections of fence placed between the Exposition grounds and the reserved garden. Some of them are beautiful in design, and wonderful in their sharpness and accuracy of finish. The peculiar construction of French dwellings, with an inside court shut out from the public streets or avenues, makes a demand for highly ornamental and somewhat costly entrance gates, which does not exist with us.

## ORNAMENTAL CASTINGS.

The use of cast iron for ornamental purposes has evidently made great progress. The substitution of iron for bronze in artistic productions, is of comparatively recent date, yet the visitor who sees the results in the present exhibition is compelled to acknowledge that iron will in the future be substituted to a great extent for the alloys of copper, in the production of large ornamental or monumental works. As an evidence of this, we have the splendid monumental fountain and groups of figures of animals, on one side of the grand entrance to the Park, from the foundries of Durenne, and inside the building, extensive displays of statues, busts, vases, stag's heads with antlers, and a variety of tablets and smaller objects. From another establishment, we find a splendid series of figures and groups of life size, most of them Scripture subjects for the adornment of churches. One group, for example, represents the crucifixion, with the Saviour and the two thieves of life size. The form and spirit which the sculptor gives to the model is rendered perfectly in the rigid iron. Almost all of these objects are shown as they came from the mold. The surfaces are perfectly smooth and even, and the founder is amazed at the accuracy

with which the different parts of the mold were brought together. The suture lines are sometimes hardly visible, again they appear as thin films rising from the surface, so that they may be dressed away without injury to the figure. They are all cast hollow, and the cores are supported by iron rods or wire.

I do not see in the Exposition any evidence of an extensive application of cast iron to architectural decoration. It is true that the building is in great part made of iron, but there is little or no attempt at ornamentation. I have not seen any "iron fronts" in Paris, and in fact I doubt if the material is tried anywhere in Europe, as freely and to such good purpose in building as with us. Their railway stations, generally, are marvelous structures of iron and glass, but there is little attempt at artistic display. A section of one of our iron front buildings, such as are made in the foundries on First street, would have attracted great attention here.

Paris, Aug. 27, 1867.

## What Some of our Mines are Doing.

A correspondent sends us the following, which he assures us is correct to the letter—even to the one inch wide of solid gold! The locality mentioned is well known as one affording very rich placer mines. We give the manuscript as we received it:

Without going across the mountains or into adjoining Territories to look for rich claims, we will here mention one of our cement or gravel claims and its yield. In a little obscure place called Bath, in Placer county, is a mine called "The Paragon," the owners of which were but recently all poor men, having no capital except their own labor and perseverance. Some years since they commenced running a drift into the hill, and have kept steadily at work, until now they employ fifty men and run a 20-stamp mill, crushing this cement. The length of the lower tunnel, for draining, is now 2,250 feet, while the upper works are being drifted or breasted some 1,200 feet, having shoots and dumps at various points for discharging the cement from the pay streak above, down into the main tunnel below, some twenty-five feet. This drains the works above, where the men can work comparatively dry. The claim itself is 8,000 by 800 feet. The work done thus far is the best and most systematic in the State; is thoroughly tested, and there is half a million dollars in sight. Ahead of their work the gold can be distinctly seen in every drift by the light of a candle. The company consists of four men, who are dividing the sum of over \$6,000 every month regularly, and the mine can be made to pay more than twice that amount by adding 20 stamps more; which would give them at least \$150,000 per annum over all expenses. They have now on hand 40,000 timbers and logging, 1,300 cords of wood, cut and housed, with a tract of timber land containing thousands of cords more, and a large dwelling-house. The working department is complete, with twelve or more cars, good rail tracks, over 300 picks, and all the necessary working apparatus.

This may, perhaps, be called one of the very best mines of its class in California. The strata now being worked is not on the bed-rock, but from twenty-five to forty feet above. It is very even, having a gradual incline toward the front of the hill, and, unlike many others, does not form a basin toward the center. The gravel, however, is richer in the back part. That the cement is richer on the bed is proven by the adjoining claims, which are about forty feet below, and are yielding some very heavy gold. It is supposed that at least three pay streaks exist in this deposit. The whole hill will pay, from top to bottom, say 300 feet. When it is all worked millions of dollars will be realized. The fall from the bed-rock to the cañon below is some 600 feet; so that altogether it is as if nature designed this spot as one that will furnish us with the precious metal for half a century to come.

Adjoining the above are other claims belonging to individual companies, all of which pay well when worked. Mr. Rausch has a very rich hydraulic claim, which has been washed off some 200 feet back, the gravel being about 100 feet deep thus far. The same gentleman has also struck a quartz lead excellently in richness anything ever seen in California, there being a pay streak of one inch wide of solid gold through the pay quartz, which is two feet or more thick. This is not in the gravel claim, but about a mile distant. The claims called the "Rough Gold" and the "Golden Gate," both cement claims, are good paying ones, so that there is not a single failure of any mine at the locality of Bath, in Placer county.

## Mechanical.

## The Philosophy of Chimney Construction.

To construct a chimney which will carry smoke, has been found in practice one of the most precarious objects of mechanism. So little is the theory of smoke and draught understood, that if a chimney is constructed to draw well, it is generally a matter of accident. Very few mechanics seem to have any rule for constructing chimneys which will insure a good one. The true philosophy of smoke and draught is, that cold atmospheric air tends to the center of gravity till it meets with some obstruction, which gives it another direction; that heated or magnified air is exactly vertical in motion; that hence the flue to carry it off should be perfectly vertical, and in no place of smaller dimensions than at the bottom or first inlet. It matters not how many inlets there be to it, provided the area of a cross section of the flue be equal to those of all the inlets combined; it may be greater, but it must never be smaller. If, therefore, you start with a single flue from the cellar, you must regulate the size to cover the area of all the contemplated inlets from bottom to top. Carry it up, all the way of the same size, in exact perpendicular direction; the wall need not be more than the width of one brick in thickness. Wherever you want a fire-place, attach jambs of the usual shape, leaving the common perpendicular wall of the flue for a back, throwing the arch across, at the proper place, in the usual form, covering it tight to the back wall. Immediately opposite, or below the covering of the arch, leave a horizontal aperture in the flue the whole width of the fire-place, from jamb to jamb, in size according to calculation previously made, and according to the height of the arch; which for jambs from twenty-four to thirty inches high, must not be less than three inches perpendicular in the opening.

There is philosophy in this theory; and practice, so far as tried, proves that there is truth in it as well. It should be generally adopted by builders.

We have before us a very excellent plan for the construction of a chimney with a multiplicity of grates, devised by Mr. Henry Antis, of England, which appears to answer well the purpose of draught and cleanliness. It reads as follows:

Beneath each grate, fitted in a fire-place, is an opening left, which descends obliquely into the flue. In this opening, on a level with the hearth, is a fire-grate fixed, through which the ashes descend from the grate above. And such is the effect, that while a strong current of air is produced, by the heat from the fire in the grate, through the horizontal aperture above, a moderate draught is also maintained in the oblique one below, which carries off all the dust; so that from a coal fire not a particle of dust escapes into the room. Mr. Antis affixes a valve to each inlet, hung in such an ingenious manner, that the mere pulling of a small brass knob closes it entirely; and thus, in case the chimney should take fire, all the currents of air may be stopped in a moment, and the fire dies at once. Not a particle of soot can ever enter your room or your fire-place; for that, as well as the ashes, all descend to the bottom of the flue in the cellar, where an opening, with a sheet-iron door, is constructed, from which these articles can be taken, and through which a sweep may enter and perform his duties, without disturbing the business or amusements or quiet of any part of the family. Where necessary, he also carries up side flues in the jambs, by which air can be introduced, to regulate the temperature of your room or the force of your draughts.

The advantages of the improvement are:

- 1st. Fewer materials are used, which cheapens the work.
- 2d. Less room is engrossed by dead brick-work.
- 3d. No annoyance from soot or ashes in your rooms—not even when a sweep ascends to clean out your flue.
- 4th. Power to regulate the temperature of your rooms, without opening doors or windows.
- 5th. Perfect security against smoke, in every room in your house.

**TRANSPORT OF EDIFICES.**—The transport of edifices from one point to another, is probably more extensively practiced in San Francisco than in any other city in the world. These edifices, however, are usually of small dimensions and constructed of wood. Perhaps the most remarkable transport of an edifice on record is that which was accomplished at Crescentino, a Piedmontese city, in 1776. An ordinary brick mason, named Serra, succeeded in taking down a brick heltry from the walls of one church and transporting it to another, at a considerable distance, without any injury to itself or to the walls of the church from which it was removed. While it was being moved through the streets of the city, a man was employed inside the structure to ring the bells at intervals. A model of the apparatus employed in this work was deposited in the library of the Royal Institute.

Perhaps the heaviest mass ever moved to any considerable distance, was the granite pedestal of the statue of Peter the Great, which is forty-two feet long and twenty-seven feet high, and of proportionate width. This immense mass of granite was transported from the Bay of Finland to the city St. Petersburg.

**SUPERIOR CONDENSING APPARATUS.**—As long ago as 1831 it was stated in the *United Service Journal* (English) that a Mr. Humphreys had actually used the same water over and over again, for three years, in the boiler of a steamer between Southampton and Cowes.

There is nothing in print, so far as we know, about the practical working of surface condensers. According to the best information we can get, the proportionate loss of feed-water, *i. e.*, the quantity required to be obtained by distillation or from an outside source, varies very greatly in different cases; and even with the same engines and boilers, the loss varies greatly under different circumstances. It is estimated at from a very small fraction up to one fourth.

**SUPERIORITY OF AMERICAN GLASS.**—It is an interesting fact, and one we believe not generally known, that the glass-makers of the United States excel those of all other portions of the world in the quality of the glass they produce. The first premium for the best quality of glass was awarded to an American firm at both the last Loudon World's Fair and at the recent Paris Exposition. In an English year book of Science and Art, now before us, published in 1832, we find the following paragraph, which is especially interesting in the above connection:

*American Glass.*—On July 21, Mr. Peyps brought to a meeting of the Royal Institution a very beautiful piece of American glass casting. It was a small plate, the upper surface smooth, but the under surface covered by a beautiful design of scroll-work, etc., in very high relief, so that as the plate stood upon a table, the reflection of light from it was of the most brilliant and metallic kind. The plate had been cast—the wheel had never touched it; yet the surface looked as well almost as if cut; and the pattern was so rich and full, and of such kind, as to preclude any imitation of it by cutting.

**GLASS HONES FOR RAZORS** were made and much approved some thirty years ago. The faces of the glass hone were "rough-ground or frosted by any of the usual means, and a grain differing in fineness was thus given to the respective sides." The hone may be moistened with either oil or water. A trial of a razor upon any slightly roughed, even surfaced piece of glass will show the efficacy of that material for such a purpose.

If you have a screw rusted into wood, or a nut or a bolt that will not readily turn, pour on it a little kerosene and let it remain. In a little while the oil will penetrate the interstices so that the screw can be easily started.

It is said that more than one eighth of all the steel now made in the United States, is from the iron ores of Lake Superior.

It is said that there are but three manufacturing of wire in the United States, one of which is in this city.

## Scientific Miscellany.

**COMPRESSION OF FLUIDS.**—The compressibility of quicksilver is very little in excess of one-millionth part of its volume for every additional atmosphere.

The compressibility of sulphuric ether is three times as great as that of alcohol, twice that of sulphide of carbon, and once and a half that of water.

Water which contains salts in solution is less compressible than pure water. The lower the temperature of water, down to the freezing point, the more compressible it is. Pure water at 30° F. is one-tenth more compressible than when at 55°. At a still higher temperature its compressibility still further decreases, but in a less degree than between 30° and 55°.

The compressibility of fluids up to 70 atmospheres is proportional to the pressure.

Up to a pressure of 48 atmospheres no perceptible degree of heat is developed in water; above that degree of pressure heat is developed.

(The experiments from which we condense the above were made many years ago. We presume that with the extremely delicate instruments now in use heat would be perceptibly developed in the compressibility of water from the start of the pressure, although less rapidly under a low degree of pressure than under a high degree.)

The compressibility of glass is very small, much less than that of quicksilver.

**ELECTRICAL CURRENTS.**—If a slender, sharp-pointed instrument—a needle, for instance—be made to revolve rapidly while piercing a card, it produces an elevation or "bur" around the opening on each side of the card. It has also been observed that the electric discharge produces the same appearance; hence it has been inferred that the electric current moves with a rotary as well as forward motion. This bur around the hole made by the electric current being on both sides of the card, was formerly attributed to a double current—that is, a discharge was supposed to take place from both the negative and positive poles, each discharge making its bur on the side of the card opposite the pole from which the discharge proceeded. The needle experiment, however, showing that a rapid revolution will form a bur on both sides, although the perforating instrument is moving in one direction only, does away with the necessity of supposing a double current to account for the phenomenon of the electrical bur, and the rotary motion and single current is the theory now adopted.

**A NEW THEORY.**—Herr Schultz, of Berlin, announces to the French Academy of Sciences the theory that the electricity of the tissues of the human body results from the action of common salt, which is abundantly distributed through the system. He has found that the electricity is much more abundant when the proportion of salt present is large, than when it is small. He describes numerous experiments he has made confirming this theory. Thus animal electricity, or animal magnetism as it is generally called, is excited or generated by the introduction of salt into the system, and the quantity or power of this electricity is regulated by the quantity of salt used. In other words, our bodies are electrical batteries, and common salt is the proper agent to excite them to action. Herr Schultz supposes that we may have not only the key to the mysteries of animal magnetism, but one that, in the future, will open to our wondering and enraptured vision still greater mysteries. The more powerful batteries, it is well known, control the weaker ones, which accounts for the fact that only certain persons possess the power of magnetizing others.

**PROF. R. PUMPELLY**, the well known geologist and mineralogist, has been engaged the past summer in exploring the Menominee region near Lake Superior. He has already reported the discovery of three "iron mountains" and a valuable quarry of marble. The Menominee is a river on the Michigan side of Lake Superior.

**AN OBSERVATORY AT BROOKLYN, N. Y.**—Mr. James Campbell, of Brooklyn, N. Y., has erected in his garden, on the heights overlooking the river, an astronomical observatory which has cost him \$20,000. His telescope is a 12-inch refractor, with a focal distance of seventeen feet. It was made by Alvin Clark, of Cambridge, Mass., the most skillful telescope manufacturer in the world, and is said to be one of the best and most perfect instruments of the kind existing. It is the same one to which we alluded, some weeks since, as having revealed the fact that the small star of the ninth magnitude, half way between Phocion and the neighboring double star of the sixth magnitude, was itself a double star. This star has probably been gazed at more than almost any other star in the heavens, as it is the one which has universally been employed in defining the relative power of new telescopes; yet it had never before appeared double to human gaze.

Mr. Campbell, not satisfied with this splendid achievement and handsome tribute to science, has determined that the city of his home shall possess a finer instrument still than his own. He has accordingly interested several prominent citizens of Brooklyn with himself in the construction of a still larger monument to science, which he proposes shall be built in the public park, now laid out, at Prospect Hill, and in which shall be mounted a *twenty-five-inch refractor*, which would altogether eclipse anything else of the kind yet conceived of. Mr. Campbell starts the proposition with a liberal subscription from his own purse. It is to be hoped that the wealthy men of Brooklyn will not fail to carry out the enterprise. Of course nobody but Alvin Clark would be thought of as the constructor of a telescope for such an observatory.

**THE SPECTRUM.**—The science of the Spectrum is now as well settled as that of chemistry, and by it is clearly established the nature of the material which emits light, or of the material through which it passes. By it is proved that the moon has no atmosphere, while Jupiter has an immense atmosphere, generally like our own, but in some materials entirely different. Venus either has no atmosphere, or one filled with dense clouds. The sun is largely composed of iron, intensely heated, and is surrounded by an immense atmosphere.

In certain stars are found sodium, magnesium, hydrogen, bismuth, antimony, mercury, etc., but in others there must be new matter, of which in the earth we have no knowledge.

On the 12th of May last, a bright star of the second magnitude burst out in the constellation Corona. The spectrum proved it all on fire—an intense melted mass, surrounded by a vast gaseous atmosphere, in a flame. One of the elements in this flame was hydrogen. Whence could come such a sudden addition of this inflammable gas? It has proved that some nebulae are only gas in a state of flame or great heat, irresolvable into stars by any power of telescopes. They may be condensing into stars and planets of the future.

This much has the spectrum done in about a decade. What may we not expect from it in the future! Its extensive practical application to the arts is by no means an impossible or even improbable thing. There is good reason to believe that it will yet be usefully employed in many metallurgical operations, to tell us what is going on in furnaces where great heat is employed, and where but few eyes are found available.

**A HYBRID GRAIN.**—It is said that a scientific Scotch farmer has succeeded in producing a grain that partakes equally of the nature of rye and that of oats.

**A TRICK OF TRADE.**—During the time when cotton was cheap and plenty, previous to our late civil war, rope was extensively manufactured from that material all over the country, and was considered superior in quality to the best hemp or jute goods; but it became an object to economize the weight of cotton used, and in order to do this a very ingenious method was devised. A hopper containing white sand was placed over the machine at a point where the three or more strands were being united, and a fine stream of sand was thus introduced into the fibers as the rope was twisted, thus greatly adding to the weight of each bundle.

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, Oct. 21, 1867.

President in the chair. About thirty members present. J. C. Burt was elected a resident member, and Prof. Alexander, of Honolulu, a corresponding member.

**Donations to the Library.**—Prof. Bolander presented four volumes of Kunth's synopsis of the famous voyage of Humboldt and Bonpland. Gregory Yale presented a variety of interesting catalogues and pamphlets, one of which relates to the discovery of America by Northmen. Mr. Yale also announced the desire of the Royal Antiquarian Society of Copenhagen to exchange publications with the Academy.

**Contributions to the Cabinet.**—Prof. Bolander presented a large bundle of plants, collected and prepared by Dr. Kellogg and himself.

**Project for Building a Hall.**—The committee appointed to devise some plan for securing a lot and the erection of a building thereon suitable for the accommodation of the Academy, reported in favor of asking State and city aid for that purpose, in addition to special subscriptions from members and the public at large. It is believed that the rapidly growing membership of the Academy, its position as the center of a new field of scientific research, and the great interest now being taken in the transactions of the Academy, not only by our own citizens but by scientific bodies in all parts of the civilized world, fully warrant the steps proposed in this direction. The committee was continued.

EXPLORATIONS IN ALASKA.

Several very interesting letters were read by Prof. Whitney from Wm. H. Dall, chief of the scientific corps of the Russo-American Telegraph Company, in which it was stated that the operations of the corps, thus far, had been attended with great success. Mr. Dall proposes, notwithstanding the abandonment of operations by the company, to continue his labors of exploration, at his own expense, at least for one year, with the view of carrying out to completion the work left unfinished by the death of the lamented Kennicutt. This young and intrepid laborer in the cause of science traveled over 400 miles on snow-shoes, last winter, camping in the open air with the thermometer from 8° to 40° below zero. He had even seen it 68° below. In a letter to Professor Whitney he writes that he had paddled a canoe 650 miles from Nutato up the Youkon river, where he met Capt. Ketchum and party, returning from a trip 600 miles still further up—making 1,250 miles of open river boating up that magnificent river, the chief part of which now flows through American territory.

FIRST NOTES ON THE GEOLOGY OF ALASKA.

In a letter to Prof. Whitney, which was also read to the Academy, Mr. Dall gives a diagram illustrating the geology of Alaska in the region explored by him so far as he had ascertained it. He had obtained a set of the rocks from Fort Youkon to the sea, sufficient to determine the geological formations for 1,300 miles. The following notes are full of interest: "The only fossiliferous beds are on the Youkon, and extend about 600 miles—brown sandstone, containing halves, mollusca and vegetable remains. They are rare—only found in thin layers—and it took several months of searching before I found any. There is a small seam of coal thirty miles below the bend, and thin shale above and below. Very few and poor vegetable remains are found here resembling fuci. The coal is of good quality, but so little of it that it is worthless. These are the only fossiliferous strata I have found so far. The rocks above and below are all azoic and non-stratified, except a little hard blue or black slate. Granite, and especially mica, are very rare. I found a pebble containing the well known fossils of the Niagara limestone on the beach near Fort Youkon. There is a broad patch of volcanic eruptive rock on the river near the lower bend, and it extends to the sea. The islands of St. Michael and Stuart are formed of it, and it is roughly columnar on the former near this fort. The columns are five-sided, and just on the beach."

A SECOND YOSEMITE VALLEY.

Prof. Whitney exhibited a number of photographic and stereoscopic views of scenery at the headwaters of the Tuolumne river, including views of Mount Dana, which has an elevation of 13,000 feet, and is the highest peak of the middle Sierra; of Castle Peak and of Tuolumne Valley—taken by Mr. Harris, photographer with the topographical party of the State Geological Sur-

vey. He also read a remarkably interesting description of Tuolumne Valley, by Mr. Hoffman, of the Topographical Corps, from which it appears that there is a second Yosemite, which has been hitherto a *terra incognita*, except to a few mountaineers, who have kept their knowledge to themselves. The valley is now occupied by one settler, in lonely grandeur. Prof. Whitney stated that it was formerly filled with a glacier, which could not have been less than forty miles long. The photographs plainly showed the marks of glacial action on the rocky walls of the valley. The Indian name of this valley is Hetch-Hetchy. It is about twelve miles north of the Yosemite. Mr. Sharkey is the occupant and claimant of the valley. The falls are 1,700 feet high.

Dr. Cooper stated that he had obtained testimony that volcanic action was existent in Mt. Hood, Oregon.

Prof. Whitney expressed doubts about the appearances. There might be some remnants of volcanic fires, in the shape of sulphurous vapors, as in Mt. Shasta, but he doubted the existence of volcanic action.

LEAH'S CONFESSIONS, an Autobiography: A. Roman & Co., San Francisco.

This is one of Roman & Co's latest publications. It is a neatly printed, book of 130 pages. It is a story of woman in her domestic trials, and as such will find ready and sympathetic readers. The scene is laid partly in California. There are many passages of interest, descriptive of trials peculiar to woman, and eloquent arguments in behalf of woman's individuality of life. The book will no doubt be extensively read by all California lovers of light literature, as well as by many in the Eastern States.

**NEW INCORPORATIONS.**—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

**LIVE STOCK ASSURANCE Co.**—San Francisco. Oct. 22d. Capital stock, \$200,000. Trustees: George Treat, John Center, Alexander Ely, John Anderson, S. C. Bowley and C. M. Chase.

**WATER FRONT LAND Co.**—San Francisco. Oct. 24th. Capital stock, \$200,000; 50 shares, \$4,000 each. Trustees: W. P. Harrison, Joseph M. Parker, B. M. Atchinson, David Dwyer and George H. Lovegrove.

**ELECTION OF OFFICERS.**—LADY BELL COPPER MINING Co.—Oct. 24th. President, J. McGill; Secretary, B. P. Wilkins; Treasurer, D. A. Macdonald. Trustees: D. A. Macdonald, J. McGill, John W. Farrier, David Hunter and B. P. Wilkins.

**EXCHEQUER MINING Co.**—Oct. 21st. President, S. Heydenfeldt; Secretary, David T. Bagley; Treasurer, John Sime. Trustees: S. Heydenfeldt, A. K. Grim, John Sime, A. P. Crittenden and Jos. Tilden.

In the case of Cyrus Palmer vs. the Tar-

**THE FIRST FLOWING WELL—PROBABLY.** We have before us the following extract from a number of the Louisville *Advertiser*, published some time in the year 1831. "A spring of rock oil has been discovered in the county of Cumberland, while boring for water. On reaching the depth of 130 feet the oil gushed out, forming a jet 12 or 14 feet above the ground. It flowed out at the rate of 75 gallons per minute, and very soon found a little stream, which ran into the Cumberland river, and covered its surface for a considerable distance. The oil burns well and gives a brilliant light."

**HUNTER'S CONCENTRATORS.**—Mr. Hunter shipped 56 of his concentrators by yesterday's boat, for Virginia City, with the irons for one amalgamator, which will be used there as patterns for building others. Mr. H. uses one amalgamator for four concentrators. He intends to put up all of his concentrators and run them with their complement of amalgamators on his own account, upon tailings which he has purchased for that purpose.

**PICNICS.**—All in search of health, pleasure, or recreation, will find Woodward's Gardens one of the most desirable places of resort this side the garden of Eden.

The European watchmakers appear to be very much alarmed at the progress of watch-making in America.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 26, 1867.

City Stocks.

In city stocks little has been done during the period under review, though the amount offering is very considerable. There were sales of San Francisco Gas at \$7 75, and at the close at \$68. Spring Valley Water was in the market at \$67 75@68 50 per share. North Beach and Mission Railroad stock continues to be well maintained, sales having been effected at \$53 per share.

We note considerable sales of Legal Tender Notes at 70 1/2 cents, and 71 cents seller 30. Our latest advices from New York quote Gold at 142 1/2, and Sterling 108 1/2. The receipts of the local insurance companies during the first nine months of 1867, according to the returns made to the Internal Revenue Department, have been as follows:

COMPANIES.	September.	Previously this year.	Total.
Pacific.....	\$72,535	\$83,727	\$555,332
Union.....	22,708	221,334	254,042
National.....	31,259	181,330	212,589
Fireman's Fund.....	16,170	117,013	133,183
Builders.....	29,206	17,438	152,849
California.....	18,024	77,268	95,292
Merchants' Mutual Marine.....	16,548	118,785	132,333
Occidental.....	9,063	58,429	67,492
Home Mutual.....	8,546	73,631	82,177
San Francisco.....	4,865	35,097	39,962
Totals.....	\$235,210	\$1,494,972	\$1,730,182

The returns were made upon a legal tender basis, the rate being fixed every month by the Collector of the district, as follows: In January, 74 1/2; February, 73 1/2; March, 75; April, 75; May, 74; June, 73; July, 72 1/2; August, 72; and September, 71.

The aggregate decrease of receipts in September as against August is \$13,396. The receipts of the several companies in September as compared with August, show the following difference:

	Increase.	Decrease.
Pacific.....	\$11,192	\$8,405
Union.....	538	—
National.....	—	3,719
Fireman's Fund.....	—	4,535
Builders.....	9,733	—
California.....	—	164
Merchants' Mutual Marine.....	151	—
Occidental.....	—	5,189
Home Mutual.....	—	—
San Francisco.....	506	—

The receipts in August were more than \$50,000 in excess of July, and all the companies exhibited an increase of business for the month, while the returns of September show an aggregate decrease of \$24,344 in six companies, and an increase of \$10,948 in four companies.

The receipts of the city railroads for the month of September and previously this year have been as follows:

	September.	Previously this year.	Total.
Omnibus.....	\$24,384	\$169,663	\$194,047
North Beach & Mission.....	24,003	157,785	181,788
Central.....	13,073	98,836	111,909
Front St., Mission & Ocean.....	8,240	52,632	60,872
Market.....	7,743	56,436	64,179
Totals.....	\$78,488	\$526,378	\$604,866

The aggregate increase of receipts in August over September is \$2,855. The difference of the income of the several companies in September as compared with August is as follows:

	Increase.	Decrease.
Omnibus.....	\$1,221	\$—
North Beach & Mission.....	—	142
Central.....	—	128
Front Street, Mission & Ocean.....	287	—
Market Street.....	693	—

The city railroads are in a very prosperous condition, and their receipts are augmenting very rapidly. The Potrero Railroad over the Mission Bay Bridge reports the receipt of \$1,007 during the month of September.

Mining Share Market.

Since our last reference the mining share market has been characterized by a good degree of activity, showing a considerable increase of transactions in the aggregate, and withal exhibiting more animation; however, the majority of stocks comprising the call list of the Board have depreciated materially from closing quotations of last week. Several private gold quartz claims, located in California, one of which (the Hayward) is quite extensive, and has yielded largely within the past nine years, have been incorporated and placed on the market within a few days, full particulars of which will be found below.

**CROWN POINT**—has been in considerable request, advancing from \$605 to \$910, receding to \$625 under increased sales, then selling at \$700 and \$665, and closing yesterday at \$640 seller 10. The drift on the 700-foot level is still running in quartz and porphyry, and has attained a distance of ninety-two feet from the shaft. It is said that the south drift is looking more favorable. The winze from the 800-foot level is 90 feet in depth, carrying quartz containing some pay ore.

**OPHIR**—is dull of sale, a few feet commanding \$37@30, and at the close \$30 was bid. The machinery at the new shaft was started on the 24th, and everything worked well. The shaft is eighty feet in depth.

**CHOLLAR-POTOSI**—sold quite freely under a rapid decline from \$209 to \$152, then selling at \$172 50, and closing at \$163. A telegram from the 24th inst., says the "New Santa Fe" has just taken B street down," but this information has not affected the stock very materially. On the 23d, 225 tons of ore were taken from this level. During the week ending Oct. 19th, the developments in the new shaft have been as follows: Work has been steadily continued in the drifts on the fifth station; the one going south is now forty-eight feet in length, and the north one thirty-nine feet. In the south one they found no indications of ore, but the drift going north has quartz in the entire face, carrying but little metal. The ore sent to custom mills during the week ending Oct. 19th, amounted to 1,425 tons, the various etations yielding as follows: New Santa Fe, 200 tons; Pitte, 480; Old Santa Fe, 394; and Santa Fe, 34, 496. On the 22d inst., the deliveries of ore amounted to nearly 200 tons.

**HALE & NONCROSS**—sold at \$725@745 per foot early in the period under review, receded to \$650, and at the close sold at \$690 per ft. The Trustees of this company have called a meeting of the stockholders to be held on the 27th of November, "to take into consideration and decide upon the proposition to increase the capital stock

from \$400,000, divided into 800 shares, the present capital of the company, to \$1,200,000, to be divided into 800 shares of \$1,500 each." The work at the mine is proceeding quite rapidly. The ore now obtained from the 175 foot level is of a very fair grade, but the average for the current month has only been about \$24 to the ton.

**SAYAGE**—opened at \$117, advanced to \$129, under extensive sales fell to \$115, rallied to \$117, and closed yesterday at \$118. The product of this mine for the week ending Oct. 19th has been 1,944 tons of ore against 1,873 tons extracted during the previous week, showing an average of \$99 90 per ton for the same period against \$98 85 of the previous week. There has been no material change in the mine since our last issue. On the fourth station little progress has been made in the north-west drift; they were about forty-five feet from the winze. The Potosi drift has been run duo north about forty feet, and the assays from samples show from \$60 to \$70 to the ton. The south drift has been carried twenty-five feet from the main south-west drift, and the team of quartz they are following is increasing in width, and is said to occasionally contain some good ore; it is 135 feet from the south winze. The shaft is now down ten feet below the fifth station.

**AMADOR MINING Co.**—has been placed on the market within a few days, and sold yesterday at \$215 per share. This property is the celebrated Hayward mine, at Sutter Creek, Amador County, and was recently incorporated with the following named gentlemen as Trustees: A. Hayward, A. H. Rose, Samuel F. Butterworth, Thomas Sunderland, and Louis A. Garnett. The capital stock of \$1,480,000 is divided into 3,700 shares of \$400 each. The mine is now 1,210 feet in depth, and the drifts opened from this point extend over 500 feet, and are said to continue in good ore. A pump from the 1210-foot level, 20 feet in depth, is in fine ore, and the developments generally are said to show a supply of ore which it will require from four to six years to exhaust. The bullion returns during the past two weeks show a yield of \$16,580.

**YELLOW JACKET**—declined from \$480 to \$310, improved to \$380 in the open board, and closed at \$342 50. The *Trespass* of the 19th inst. says: "In the north mine there is no change to note. At the south shaft the winze, about 20 feet from the Kentuck line, is in excellent ore, and the body is widening to the south. The shaft to-day is down 110 feet toward a new level, which will be commenced when 180 feet shall have been attained. A sufficiency of ore is being hoisted to supply the Morgan mill with ore for reduction. The new machinery at the shaft has been completed and is now running."

**GOULD & CURRY**—is in somewhat better favor, having improved from \$295 to \$350, then sold at \$310, and closed yesterday at \$330. The Bonner shaft has been cleared of water, the slum at the bottom removed, sinking resumed, and also worked on the east drift from the sixth station. The old works of this mine are still producing from seventy to one hundred tons of low grade ore per day. The mill is in fine running condition, but is much inconvenienced for want of water.

**OVERMAN**—has again become one of the active stocks on the list, opening at \$64, dropping to \$45, improving to \$63, receding to \$50, rising to \$62 50 seller 10 in the open board, and closing at \$45. We learn that the 300-foot level has been extended to the Unclio San ground, though the old works of that company have not been reached. It is reported that in a "red ledge" pay ore has been found which assays from \$37 to \$50 per ton. A cross-cut on the ledge, it is also said, shows twelve feet of ore. The receipts of bullion from the 1st to the 24th inst. amounted to \$30,647.

**KENTUCK**—was in the market to a considerable extent at a marked decline, rapidly receding from \$238 to \$173, rallying to \$197 50, and closing yesterday at \$182. The returns from the Petaluma and Pacific mills, from the 1st to the 20th, inclusive, show a bullion yield of \$42,921 75. Two additional mills have been employed during the same time, from which no report has yet been received, and to which 328 tons of ore have been delivered. The assays of ore from the 1st to the 18th show an average of \$46 74 per ton, and from the 13th to the 21st, \$56 18.

**IMPERIAL**—has been well maintained within a range of \$127 50@131, and at the close \$130 is bid. The bullion returns from the 1st to the 24th inst. amounted to \$25,763, against \$41,737 during the same time in September.

**BELOCHER**—opened at \$115, then sold at \$105@100, assessment of \$15 delinquent, and at the close \$100 is asked. **GOLD HILL QUANTZ** realized \$100 early in the week, and closed at \$90. The 290-foot level, in running west, is said to show a good breast of ore; the width, however, is not well defined, but is reported to be over ten feet. No ore has yet been reached on the 450-foot level.

**CONFIDENCE**—advanced from \$35 to \$55, seller 3, and at the close \$37 50 was bid. **BULLION** declined from \$18 to \$14, advanced to \$15, and closed at \$16. An assessment of \$10 per share was levied on the 22d inst. **SERRA NEVADA** obtained \$12 50@13 50, and at the close \$10 is bid. **EXCHEQUER** was in the market at \$8 per share, and SEGREGATED BELCHER at \$6 50@5 50. **JUSTICE AND INDEPENDENT** sold at \$2@1 75. The assessment of \$10 is now delinquent.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last amounted to \$1,057,421. The sales in the open sessions, from the 19th to the 24th inst., inclusive, amounted to \$523,086, showing a combined aggregate to date during the past week of \$1,580,507.

**NATURAL HISTORY.**—It is said that a number of young people, pupils of the Normal School and others, of this city, have taken steps to organize a society for the study of natural history. The opportunities needed for such an enterprise are just what are proposed in another column, in connection with the future improvements of Yerba Buena Park, that is to be.

The farm of the celebrated Roman, Cincinnati, consisted of only four acres, three having been lost by becoming security for a friend.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Oct. 12th: The Mowyer Co. have struck their lode in the main tunnel. The west wall was well defined, a pretty clay casing, and everything indicating a true lode. The quartz found contains sulphurets in large quantities, but whether rich in the precious metals or no has yet to be determined. The superintendent will immediately proceed to cut through the lode, to thoroughly test the character and width at the point struck.

The tunnel in the Merrimac is in 75 feet. Samples of rock picked off the side of the lode show ore of a high character. The ore appears to be a silver-bearing zinc blende, containing copper, iron and antimony.

A recent assay of decomposed pocket ore from the Alpine tunnel, found 24 ft. from the mouth of the tunnel, gave \$41.23 in silver and \$12.40 in gold to the ton; total, \$53.63. The same substance found in the pocket on starting the tunnel did not show a trace. The hard quartz, also, which at first only showed where the ore had been, indicated by a red stain, now contains some black ore.

Oct. 19th: The Silver Creek quartz mill commenced running again this week, and is putting through Tarshish ore. The first class ore is now concentrated or washed before crushing, to rid it of the fine light clay, which renders the pulp in the barrels difficult of manipulation.

The Tarshish is looking better than at any previous time. The winze, at a depth of 35 feet, struck a rich pocket, which, on being drifted upon, yielded several tons of first class ore, and good ore is found at several other points. In the face, nearly 100 ft. in the ledge, small pockets of rich ore are numerous.

## Amador County.

*Ledger*, Oct. 19th: The Clear Lako Borax Co. are taking out 35 tons per month, and find a ready market for all they can produce.

## Calaveras County.

*San Andreas Register*, Oct. 19th: Capt. Ferguson has struck a rich lode of quartz at Hay Press Flat, on the San Antonio Ridge. Bean & Martin crushed eight tons of quartz from the lode in a small water arastra, from which they obtained 8 lbs. of amalgam. The lode is large, and experienced quartz miners have pronounced it one of the best in the State.

C. V. McNair has located upon and prospected another portion of the same lode, from which he has taken considerable rock. It prospects as well as the above.

In the same district, the Washington claim has had 48 tons of rock crushed, which paid \$67 per ton, and the second quality rock is paying \$15 per ton. Other claims—the Lado, the Feuiau, and the Mountain Quail, in the immediate vicinity, prospect equally as well.

Mr. Irvine is now opening his works under ground by tunnels and excavations, so as to add 20 or 30 hands to his mine.

*Chronicle*, Oct. 19th: We were shown this week a small diamond and a number of other precious stones of various characters, which were found near town.

*Stockton Gazette*, Oct. 19th: The Quail Hill mill at the first run produced \$2,000, and the leads located on this range are at present exciting considerable attention. This mine is a deposit of auriferous talcose slate, mixed with ochrous earth and decomposed quartz. The surface was washed as a placer claim, and afterwards some good copper ore was found in it, and now it is worked as a vein mine for gold. The abundance of the auriferous matter, and its softness, render it possible to crush two or three tons per day to the stamp. The outcroppings of this vein are characterized by that species of ledge well known to copper prospectors as "calico rock." It has been suggested that there is every encouragement to prospectors to search along the eighty miles intervening between Quail Hill and the Harpending mine in Placer county, where a similar character of ore has been discovered.

## Mariposa County.

*Gazette*, Oct. 12th: A Chinaman on Monday last, accidentally dropped upon a piece of gold weighing 2½ lbs. He had occasion to go to one of the small ravines which lead from the Mariposa Co's vein and passes through town, and while there saw something glittering in the dirt. On examination he found it to be a lump of gold which weighed nearly 2½ lbs. The ravine has been rich in placer gold, as have others leading from the same vein, and this piece is supposed to have been thrown out a year or so ago in excavating for a foundation for

a small house. The place will be thoroughly worked this winter, when probably many larger nuggets will be found.

## Nevada County.

*Gazette*, Oct. 16th: The Illinois and Wisconsin are now taking out splendid rock. The last crushing yielded over \$80 a ton, and there are now some 200 tons above ground, ready to be crushed, which the owners are confident will pay nearly as well.

Rich quartz is now being taken from the Seven-Thirty Loan ledge near Grass Valley. An incline has been sunk to the depth of 90 ft., and the prospects are flattering.

Oct. 17th: Very good prospects are obtained in boring wells in the foothills near Bear river. One person states that he prospected gravel taken from one of the claims, and invariably found numerous colors of fine gold. The depth from the surface to the bedrock is 75 ft., with two ft. of auriferous gravel at the bottom. Above the gravel there is a stratum of cement, three or four ft. thick, and next is a layer of eight or ten ft. of quicksand.

Oct. 19th: The Black Bros. have sold their gravel claims at Empire Flat, near French Corral, for \$14,000. Williams, Morgan & Co. were the purchasers. The claims have been paying largely for some years, and are quite extensive.

*Transcript*, Oct. 19th: A rich quartz ledge was discovered a few days since, by Chas. Ott and Lewis White, on Deer Creek, above the Oriental mill. The ledge is 15 in. wide on the surface, and shows free gold all over the face of the rock. The quartz has a rich seam of sulphurets running through it.

The Bed Rock tunnel is now in 2,000 ft., and the distance to the Flat is probably as much again; but the workmen have been greatly encouraged by the fact that Black Bros. in opening their ground on the Flat for surface washing have crossed the identical seam upon which the tunnel is being run.

Oct. 22d: Messrs. Clark & Poquillon have purchased the 5-stamp mill of Lambert which they will move to Eureka and add five more stamps, making a first rate 10-stamp custom mill. It is expected to get the new mill in operation in about four weeks. There is a large amount of prospecting about Eureka, and there is no mill in the immediate vicinity which is designed for custom work, and men who have rock to work have to wait the convenience of the mills erected on the several mines in the vicinity.

*Grass Valley Union*, Oct. 15th: The North Star mine has been yielding very handsomely lately. In the lower or 800-ft. level on the incline the vein is showing a width of from 2½ to 4 ft., and the rock is as good as any that has heretofore been taken out, and better than the previous yield from the 800-ft. level.

We were shown yesterday, by Mr. E. Pratt, a lot of very rich rock taken out last week from the Seven-Thirty Loan quartz mine, near Deadman's Flat, southwest of Grass Valley. The specimens were taken from different parts of the level run at the bottom of a 90-ft. incline. The specimens were singular in variety, showing free gold in crystalline quartz, in the ordinary ledge rock, and in beautiful sheets of leaf gold, that looked as if they might have been fashioned by the hand of an artisan, so bright and smooth in polish and unique in shape.

The Smartsville correspondent of the *Marysville Appeal* of Oct. 23d, says: The old channel of the Ancient river, extending from Mooney Flat to Timbuctoo, from which such large quantities of gold has been taken, is one of the curiosities of California. Bedrock tunnels have been run through the rim rock, which in some cases, has required the work of years. A few companies are now engaged in working off the upper stratas of gravel and cement, preparatory to running tunnels to open the old river channel. The Babb Co. at Timbuctoo, worked off the upper strata to the depth of 180 ft. some years since, from which over \$250,000 were realized. Within the last two years they have put in a short bedrock tunnel which enables them to work a few feet of the old river bed and some 50 ft. of the upper strata. From this they are washing into their flumes over \$500 per day. The O'Brien claims adjoins the Babb on the east, having 1,100 ft. on the channel, which at this point is covered with a hill of pay gravel, over 200 ft. in depth, before reaching the old river gravel. This upper strata is now being worked to the depth of 140 ft., paying from \$150 to \$325 per day's washing. In the McAllie claims a tunnel has been run 1,200 ft. from the river rock on one side to the rim rock on the other. Washing through this tunnel has just commenced with flattering prospects. Shafts are being sunk on the Pittsburg and Yuba River Co's mine. East of this is the celebrated Blue Gravel mine. Its length on the channel is about

1,100 ft. Their present tunnel is not low enough to enable them to work to the bedrock. It is supposed that there is 40 ft. of gravel below their present flumes, which will require a lower tunnel to work it to the bedrock. This mine has yielded its lucky owners nearly \$900,000 and continues to pay from \$20,000 to \$57,000 at a wash up. The Union and Blue Point Gravel Co. is washing off the upper strata to a depth of from 40 to 140 ft. This is washed through two flumes of one mile each in length, and is paying from \$250 to \$400 per day in each flume. A bedrock tunnel 2,200 ft. in length is now being run, a contract for a section of 400 ft. is being prosecuted at the rate of from 30 to 40 ft. per month. Two shafts are now down to the grade tunnel, at a cost of \$4,000 each, and bids for running tunnel each way, from each shaft will be received until the 31st of October, contractors binding themselves to prosecute the work day and night until completed. The company pay premiums of from \$500 to \$1,000 for the early completion of these contracts. The Nevada Reservoir Ditch Co. are also preparing to run a tunnel under the gravel hill which divides Sucker Flat from Mooney Flat, so as to work the extension, and rich mining ground of Mooney Flat, which has remained unworked for want of outlet. This tunnel will be 3,000 ft. in length, through gravel and cement, and opens out Mooney Flat mines to the depth of 80 ft. at the lowest place, and as the dividing ridge is worked off, the bank of gravel and cement increases to 515 ft. in depth, with the old river bed beneath all.

*Excelsior*.—Meadow Lake *Sun*, Oct. 19th: The Occidental Co. are now at work on their claim, and the developments are very encouraging. The Mohawk and Montreal Co's mill has started up again upon their own ore. The plates are heavily coated with amalgam, and everything is working to a charm. As soon as they finish crushing the rock which they now have on hand, they will run through a quantity of ore for the Gold Run Co.

The Eclipse Co. have their shaft now down 37 ft., and their rock is looking fine.

## Placer County.

*Stars and Stripes*, Oct. 16th: It is rumored that the title to the Good Friday claim will probably be the subject of litigation at the next term of Court. In this claim there is a thread of quartz about two inches wide, which is very nearly half gold. In one week the two gentlemen who are in possession took out about \$5,600. Those who contest their claim do so under a copper mining location, they claiming that the location for copper mining holds for gold as well.

A miners' meeting was held in Auburn on the 12th of October, having in view the designating of mineral lands in that vicinity, and of remonstrating against the patenting of such lands.

A correspondent at Dutch Flat, discussing the question, "Do metals grow?" says: "I can within a mile of this place go with my pick and pan and collect sulphurets containing gold, which have been formed within the last ten years, in clean gravel tailings washed years ago from old claims. The gravel has been cemented together by it."

Dutch Flat *Enquirer*, Oct. 19th: The sulphurets in the Alta ledge are said to be very rich, a portion of which have been worked by Dr. Dozier's process, and yielded as high as \$1,300 in silver and gold to the ton.

## Plumas County.

*Quincy National*, Oct. 12th: Morris' claim, at Carriboo, is paying an ounce per day to the man, and the Jaw Bone Co. are taking out the ore handsomely.

At Dutch Hill, in what is called the Cummings claim, D. S. Zearing last week took out a nugget of pure gold weighing 18 ozs., and has found several pieces nearly as large during the past season. Mechling & Calvert, Ely & Benham, Bryan & Emmons, and the Dutch Hill Co., all are making good wages.

Wm. Gamblin, of Rich Gulch, last week took out 40 ozs. of gold from his claim at that place.

Miron Waggouer and B. M. Ferguson have purchased of D. S. Zearing the Cummings claim at Dutch Hill.

At Missouri Flat, near Rich Gulch, Mardon & Brothers have struck rich diggings, which will pay \$20 per day to the man, and the prospects are that the diggings are extensive.

At Rush Creek the mines have been paying better this season than for several years past. Fred. Lewis last week took out of his claim \$300 to one pan, one piece weighing 11 ozs. Roeddy & Co's claim is paying an ounce per day to the man, and F. Smith's claim one-half an ounce. R. Gise's claim continues to pay well. Serrin & Brown are running a bed-rock tunnel to open their hydraulic claim, where they expect to take out much ore.

Sherman & Bro., of Argentine, have sold their upper ledge, purchased of Gilson & Lannis, to Heath & Co., for a consideration of \$400 and sufficient water to run their mill on the Hesler ledge for two years.

The undivided half of the Grey Eagle mining claim, at Barker Hill, is advertised for sale. This claim is now paying \$8 per day to the hand, and affords an opportunity for a good investment.

## Sacramento County.

*Folsom Telegraph*, Oct. 19th: The miners in this township are doing well. We heard of a heavy clean up a day or two since, by one company, and if we had not promised the assertion so often made, that the mines are worked out.

## San Bernardino County.

*Guardian*, Oct. 12th: We saw this week a large quantity of rock from the Zapata mine, and, as far as appearances go, we have seen no better or more promising from any ledge we have ever visited, embracing the famous Gould & Curry, Ophir, Savage, etc. Should this ore not turn out as well as either of these, all we can say is, that appearances are very deceptive. The lode has been well opened both by shaft and tunnel, and exhibits in the latter a mass of rock perfectly surprising. The lower wall is well defined, and the lead is opened between two and three feet, although the hanging wall has not yet been reached. The ore is sulphuret of silver, containing a very large proportion of chloride.

## Shasta County.

*Courier*, Oct. 19th: The mines of Soda and Hazel Creeks, above Portuguese Flat, are paying unusually well this year. The gold found is mostly very coarse, and pieces weighing from an ounce to \$50 are frequently picked up while ground sluicing.

Quite a number of Shasta miners have located claims at Trinity Center. Murry & Son, formerly of Pittsburg, own a claim which pays them \$5 per day to the hand, and can be worked at all seasons of the year. Fred. Kushman, formerly of French Gulch, is working a claim which pays \$7 per day, with prospects of growing better as the claim is more thoroughly opened. Other claims are paying even better than those mentioned.

About two years ago a Chinese company purchased the old Briggsville hotel and garden for \$1,100. They removed the building, fences and fruit trees, and commenced opening a mining claim on the ground. At the time some thought the Chinese would never get their money back, but the Celestials knew what they were buying. The claim has already paid several thousand dollars, and is not yet half worked out.

Work is progressing finely on the Bullion and several other South Fork ledges, all of which are looking well. Black sulphurets containing silver abound in the Bullion ledge, and occasionally a piece of rock is found to be impregnated with threads or wires of native silver.

## Sierra County.

*Downville Messenger*, Oct. 19th: The Docile Quartz Co. at Alleghany are progressing at a rapid rate with their mill. In the meantime the owners are pounding rock in a hand-mortar, and if reports are true the rock is of fabulous richness, for large sums are mentioned as the result of each day's work.

Gov. Wright and his associates of the Combination, in Wet Ravine, have succeeded in finding good pay ground, and are taking it out rich. At any rate they show a voucher for the truth of this in the shape of a six ounce nugget.

At the Sequel Diggings, near the old Galoway ranch, the prospects continue highly encouraging.

## Siskiyou County.

*Yreka Union*, Oct. 19th: The White Bear quartz claim is being prospected by the owners, Messrs. Pemberton & Co. They have extended down on the ledge at the point where it cropped out about 10 feet, and took out from this open cut eight tons of rock, which they crushed in an arastra. The yield was nearly \$400, or a fraction less than \$50 to the ton. The ledge at the lowest depth sunk on it, 10 feet, is 18 inches in thickness. The owners show some fine specimens taken from it.

## Tulare County.

*Visalia Delta*, Oct. 16th: Mr. A. J. Maltby brought into town last week, for shipment to the Mint, 100 ounces of bullion, valued at \$14 per ounce, the product of 25 tons of second class rock from the Eclipse mine, situated on White river, in this county.

## Yuba County.

*Marysville Appeal*, Oct. 17th: A Brown's Valley correspondent writes: "As to the Rattlesnake mine, it will compare favorably with the Jefferson, both in management and richness; and its prosperous future is everything but doubtful. The rock crushed lately in the Dannebroge mill instead of yielding

only \$6.50 to the ton, as your correspondent would have it, has paid from \$8 to \$15 to the ton, and none was ever crushed that paid less than \$8 per ton; and instead of a few pieces of or many pieces of rich rock found now and then, as your correspondent so cunningly and mysteriously intimates, there is plenty of it visible everywhere in the mine."

Oct. 22d: The Rattlesnake Co., Brown's Valley, are now taking out from their lower level and crushing at the Dannebrog Co., having struck good quartz themselves, will soon be able to supply their battery with quartz from their own claim, and the Rattlesnake Co. have therefore to go to work and put up a battery, pan and settler of their own. They are about to make a contract for that purpose with the San Francisco Miner's Foundry.

#### ARIZONA.

Miner, Oct. 5th: Prospects on Lynx Creek are encouraging. Uncle Billy Pointer last week crushed in an arastra 5½ tons of rock from the Pointer lode, which yielded just \$35 to the ton, this, too, without any picking or sorting of the rock. The ledge is a wide one, and every pound of rock taken out of it was crushed.

Bob Winning took a lot of refuse rock, that had been picked twice over by another party, crushed it, and made it pay \$9 to the ton. Strange to say, when the mill company crushed the best of this rock, they could only get out of it about \$13 per ton.

Poland & McCrackin have ready for crushing a pile of rock, which they have taken out of the Deadwood No. 2, which will pay more than \$100 to the ton.

Billy Middleton and Shep. are still following up the pay streak under their old cabins, and make it shell out to the tune of \$5 and \$6 per day to the hand. On account of the scarcity of water, they have to rock their dirt.

Noyes & Curtis, in Hassayampa District, crushed in the mill lately 7½ tons of rock, which yielded \$100 per ton.

A party of Mexicans, who have stuck to Lower Lynx Creek, through thick and thin, are now working the placers on that creek with good success. They expect to do better when water is plenty.

The Great Central or Eliza mine on William's Fork, is yielding a fine article of copper ore, at a depth of 60 ft.

Some of the mines in Sacramento Dist. will be worked at an early day.

There are about 60 men working on the Vulture lode at Wickenburg, half of whom are Americans and the balance Mexicans.

#### COLORADO.

Georgetown Miner, Oct. 3d: The editor saw a piece of bullion a few days since which weighed 24 ozs., which was taken from six pounds of ore from the Wm. B. Astor lode. The value was \$32.40 or at the rate of \$10,800 per ton.

The Terrible lode is looking splendidly. There is now a vein of 18 in. solid clean mineral at the bottom of the shaft with several smaller veins coming in. The shaft is about 35 ft. deep.

W. C. Bramel & Co. have on exhibition a fine specimen of argentiferous galena, weighing 18 lbs. The ore is from the Glenalbin lode, and assays \$349 per ton.

Gov. Patterson has a dainty pocket piece of silver bullion, that weighs 68 ozs., extracted from Cataract lode ore. The ore yields between \$300 and \$400 per ton.

C. W. Bramel & Co. have made a new discovery of a very fine lode on Republican Mountain. The ore is a very fine black sulphuret and auriferous galena, and from appearances is very rich in silver. They have named it the Correct lode.

Mr. Kalbaugh exhibited to us, a few days since, the finest piece of silver bullion we have ever seen. The bullion weighed 236 ozs., coin value \$317.60. The bullion was extracted from Combs lode ore.

The Nyanza lode is turning out a large amount of very rich ore. Five tons has been brought down for reduction.

The Muscovite lode is showing a very fine vein of argentiferous galena in the bottom of the shaft. The mine is being actively worked.

Immense blocks of argentiferous galena are daily raised from the shaft of the New Boston lode.

Prospecting is starting up again with renewed vigor. The recent discovery of some very rich veins of sulphuret ores has given a new impetus to this branch of business.

At the smelting works we saw some ores from the Cooley lode, Montezuma, and the National Treasury lode, Peru Dist., that have been brought over for reduction.

We were shown, on Tuesday last, a large and very fine specimen of first class sulphuret ore, from the Junction lode. The gangue carries considerable native silver.

Ore from the North American lode is be-

ing packed to the works of Garrott, Martine & Co. for reduction.

Work upon the Nuckolls lode is being actively prosecuted, and a large amount of first class ore is being raised.

Garrott, Martine & Co's works are now engaged in crushing ore from the Terrible lode, for Messrs. Crow & Clark.

#### IDAHO.

Owyhee *Avalanche*, Oct. 12th: Rich ore is coming out of the Oro Fino, with prospects for a continuance. The company has determined to sink a shaft on the extreme south line of the claim, to fully prove its extent. The ledge near the surface is over two ft. wide, the ore being spotted with free gold.

Col. Fogus & Co. are pushing work on their claims with much energy. Their ledge shows well.

The Woodstock is yielding some very rich ore.

The Poorman's works were stopped by the strike, but is again being started up—partly by contract.

The Oro Fino Co. have let contracts to run two tunnels on their mine—one 50 and the other 100 ft. in length. A contract has also been let to sink a shaft 100 ft. on the Poorman.

Six mills are running nearly all the time. Black's mill is also pounding away in Flint, and the Iowa Co. will probably start their new mill next week.

#### MONTANA.

Post, Oct. 5th: Hughes & Henneberry have struck good pay in Snow Shoe Gulch. Immediately after it became known, the entire gulch was located. The Stoby Co's ground commences at the mouth of Deadwood, and runs up that gulch, 2,600 feet. They are at work and taking out good pay. Three men at work five days took out \$700, and they were out in their best ground. One of them in looking over some tailings picked up a nugget weighing \$60.

The Bailey quartz ledge has been opened and developed by a Mexican who contracted to find and prove the ledge for a half interest in it. The depth of the cut where the ledge was struck is 25 ft. and strikes the lead at right angles. The side of the ledge that is laid bare presents a very fine appearance, and is thickly studded with gold which appears to be disseminated throughout the entire mass.

At a meeting of the miners of Fairweather Dist., held on the 2d inst., it was resolved that every claim shall be duly represented while the owner is working in the district, and that claims may be held by the owners without representation, provided the owners reside in the district.

Messrs. Rival, Jones, Lott, and others have purchased 1,100 ft. on the following lodes: Watsaka, Watsaka No. 2, Almaden, Julia Holmes, Deidesheimer, Poy Shippie, U. S. Currency, Rosa Bonheur, Na-chu-sa, Lost Dutchman, Red Cloud, Prolific, Rochester Gem, Rob Roy, Shabona, Waveland and Hotspur. The consideration was \$60,000. The property is all situated in Babbit Dist., Rochester Gulch, and some of the leads are remarkably rich. The same gentlemen recently purchased 13,000 ft. in the Silver Star Dist., of Green Campbell, paying him \$30,000 currency.

Denver News, Oct. 2d: The editor has been shown a button of silver weighing between 45 and 50 lbs., from the National Treasury mine in Peru Dist. It was taken out by the Colorado Gold and Silver Co., who are preparing to sink a shaft on the mine this winter.

#### NEVADA.

*Black Rock*. The *Sage Brush*, Oct. 5th, says: The Black Rock country appears to be attracting the attention of the business men of this and adjoining countries. Evans will start his mill to running next week, under the supervision of Mr. Isenbeck, and if he succeeds in working the ore there, up to the figures realized at Dall's mill, or at Gold Hill, those mines will stand a thousand per cent. above anything that man has ever known. The lowest figures ever realized from any of these ores worked by Isenbeck's process, amounted to \$148, and many batches worked as high as \$350.

#### Pahrnanagat.

The Pahrnanagat correspondent of the *Stockton Independent*, Oct. 19th, says: On the Indiana lode, they have struck an excellent grade of ore, at quite a considerable depth. Capt. Dahlgren has struck some good rock in some of his claims. Revolu Dist. is yielding rich returns for the labor bestowed. The Old Dominion mine in Hot Creek Dist., presents the finest body of ore I ever saw. The entire ledge is literally covered with horn silver. About 150 tons of this remarkably rich ore has been taken from the mine, with many more tons of the same kind in sight. The Pilot Knob works \$149 per ton. The New Cumberland is a

ledge eight ft. wide, and gives very large assays. Messrs. Miller & Montgomery with their fine 10-stamp mill at Hot Creek, are working rock from the Morcy Dist. The American Eagle is down 85 ft. and 90 tons of ore have been taken out, which pays over \$200 per ton. The Magnolia pays by mill process \$250 per ton. Very rich ore is brought from the Empire Dist., but none have as yet been worked by mill process.

Reville, Oct. 18th: Several companies are working their ledges with energy and with reasonable prospects of success. An improved quality of ore has been developed in the Indiana at a considerable depth, where the vein is also of increased size. Capt. Dahlgren has gone east to report his success to his company, for it appears that he uncovered good ore in several claims. Raymond and Conger have also gone east, and it is a matter of indifference to nearly all the people there whether they ever return or not.

#### Reese River.

Reville, Oct. 12th: Yesterday the main shaft near the fly wheel in the Manhattan mill was broken, which was the cause of stopping its operation until repairs are made.

Oct. 14th: The mines in Cortez Dist. that are being worked, are turning out well. The larger number are lying idle for want of capital. The St. Louis Co. had about 100 tons of second class ore worked at the mill of the Mt. Tenabo Co., which yielded \$130 per ton. The first class from this mine, considerable lots of which were worked at the Keystone mill, yielded \$250 per ton. The company is putting up buildings and other improvements, necessary to work the mine during the winter. The Mt. Tenabo Co. is preparing to work its mines and to keep the mill going during the winter.

The first lot of bullion from the mill of the Centenary Co. in Newark Dist., amounting to some 3,000 ozs., was brought into the city on Saturday.

Oct. 15th: We saw to-day the first bars of bullion from the mill of the Centenary Co. in Newark Dist. They were respectively .694 and .760 fine. The bars were the product of inferior ore from the Chihuahua mine, which was reduced without roasting as an experiment. Only 25 per cent. of the silver was obtained by the process. This result was anticipated by the agent of the company, who will have roasting furnaces completed shortly, when the mill will fairly begin to work.

Recent developments in Silver Bend Dist., made by the Westport Co., gives ample assurance of their possessing an extensive and rich ledge. The character of the formation in which the ledge occurs is similar in appearance to that which surrounds the High-bridge. The ore resembles that produced by the Transylvania mines, and is probably fully equal in point of richness. The mine is owned by parties in Carson City and in San Francisco, who intend to construct the necessary reduction works next spring. The ledge is from 10 to 12 ft. thick, and is surrounded on either side by a few inches of a black putty-like clay, which separates it on the west from a wall of hard talcose slate, and on the east from a wall less firm and composed of clayey slate. Nearly all the ore of the highest grade is found next to the eastern or hanging wall, and forms a body about 4½ ft. thick. Several tons of fine ore now lie upon the dump, and a large body is exposed to view in the ledge.

Oct. 17th: The building of a fine mill in Newark Dist. by the Centenary Co., and the development of the Chihuahua and Lincoln mines, have tended to bring the district into prominence. Deep chasms are in the mountain side. One cañon is named the Chihuahua, where the rocks seem to have been burst by some great convulsion, and stand in perpendicular walls a thousand feet in height. This deep fissure exposes several gold-bearing quartz ranging from two to 20 ft. in width. The ore is an anti-monial sulphuret, and its valuable character has been established by repeated tests in the mills in this city.

Some 30 tons of superior ore have been extracted, the yield of which it is supposed will be very high. The bore of the Sherman shaft is too great for the donkey-engine, which has, however, been doing its very best for a couple of months, and the work has been stopped until the new and powerful machinery can be erected. Rich sulphuret ore, glowing with ruby, has been struck in the Ethan Allen. It was encountered at the depth of 80 ft. in a compact vein 18 in. in width.

The ore produced by the Lodi ledge, in Silver Peak Dist., assays well. We saw this morning a certificate by David Lundbom of an assay of selected ore, the yield of which was \$317 of silver per ton.

Oct. 18th: Four tons of first class ore from the Taylor and Passamore mine in the Cor-

tez Dist., yielded 775 ozs. of silver of average fineness. The ore was reduced at the mill of the Mt. Tenabo Co.

Oct. 19th: The Diana mine is producing ore of an excellent quality. The reduction of 100 tons has just been completed at the Metacom mill, the average yield of which exceeded \$200 per ton.

Just now the Magnolia mine is producing superior sulphuret ore. Twenty-three tons were reduced at the Manhattan mill last week, the assay of the pulp of which was at the rate of \$222 per ton.

#### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Oct. 15th: The easings of the Neagle & Corcoran mine, where they have cut into it, assays from \$15 to \$20 per ton, silver, with a mere trace of gold. The drift which the company have been running for what they consider their main lead, is supposed to be within 40 feet of striking the same. As soon as the required machinery is put up, the company will commence operations for the thorough development of their mine.

Oct. 17th: The new hoisting works of the Crown Point mine, Gold Hill, are nearly completed; in fact, the two hoisting engines have been working for over a week past. Each of these engines is 40-horse power, with 14-inch cylinders and 30-inch stroke, with balance valves. They work in a perfectly satisfactory manner. The pump engine is of 100-horse power, with 20-inch cylinder and 4 feet stroke. It was started up Tuesday afternoon, in presence of quite an assemblage of those interested in such matters, and worked admirably. This engine is of an improved pattern just introduced from the East, known as the Hartford engine, with Wright's patent variable cut-off, and is the first one of the kind yet manufactured on the Pacific coast.

We were yesterday shown an assay of Eclipse ore, Washington district, taken from the lot lately crushed at Dall's mill, Washoe. The assay was made by Leopold Kuh, of this city, from a sample of crushed ore as it came from the batteries, and yielded \$300.03—\$294.99 in silver and \$5.04 in gold.

The new hoisting works at the Imperial and Empire shaft are progressing toward completion.

Mr. E. R. Burkin has just brought in 4½ tons of ore from the Silver Star lead, Washington district, which will be worked at Dall's mill, Washoe, on the 26th inst. The ore is supposed to be very rich. The mines of Washington district are proving among the best in the State.

The McMeans lead, American Flat, is now yielding ore that assays from \$20 to \$40 per ton. Quite a large lot of ore is now upon the dump, and crushing will shortly be made.

Considerable prospecting is being done to the eastward of the Comstock, in the direction of the Occidental mine. Several of the leads promise shortly to yield paying ore.

Oct. 18th: The Sierra Nevada Co. are still drifting in hard rock, but are battering away most industriously.

The works of the new Ophir shaft will be ready to go into operation about the first of next month. The shaft has already drained all the wells in the vicinity.

We were yesterday shown some exceedingly rich rock found on Cedar Hill by Mr. Wm. Gillis. The rock was found in a small vein, which is perhaps a spur from a large lead in the vicinity. Some of the pieces exhibited to us were literally spangled with gold. A pan of dirt taken from the vicinity of the vein yielded on being panned out about a teaspoonful of fine quartz gold.

Oct. 19th: Wells, Fargo & Co. shipped during the past week from their offices in this city and Gold Hill, 4,082 ozs. of assayed bullion, valued at \$111,500.37.

Oct. 20th: The Union mill, Gold Hill, has lately been much improved. It now reduces 26 tons of ore with the same number of stamps as were formerly occupied in crushing 12 tons in 24 hours. The capacity of the amalgamating department has been increased by the addition of a number of Wheeler pans.

The Yellow Jacket Co. have cut through into the works of the Crown Point. This connection secures a strong draught of fresh air through a portion of the mine called the "Frog Pond," in which much difficulty has heretofore been experienced from foul air, and in which there is a large amount of good ore, which can now be mined.

Trespass, Oct. 18th: The Sunderland mill has resumed work, crushing Kentucky ore. The mill has been thoroughly overhauled, and is now capable of crushing 26 tons of ore per day.

A small vein of rich ore has recently been cut on the old Kenosha ground, Cedar Hill, by Wm. Gillis and others.

Readers should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR READERS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. W. D. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Oct. 26, 1867.

## Notices to Correspondents.

**GUIDO.—FLEXIBLE STONE.**—This curious mineral and its peculiar properties has generally been attributed to the presence of extremely thin micaceous laminae. Our correspondent calls attention to the fact that tables composed of this mineral have for some centuries been exhibited at Florence; also from the following paragraph that this rare mineral is now found in India: "A great geological curiosity has just been deposited in the museum of the Hartley Institution at Southampton, consisting of a piece of flexible stone about two feet long, seven inches wide, and more than one inch in thickness, having the appearance of rough sandstone, which bends with slight pressure like a piece of india rubber or gutta percha of the same size. This very interesting specimen of geology has been placed in a glass case constructed for it, fitted with a lever, by touching the key of which on the outside of the case the flexibility of the stone is shown. It was presented to the Hartley Institution by Mr. Edward Cushman, from his relative, Mr. R. S. Munden, who obtained it from Delhi, in the East Indies. In its natural position the stone is said to run in thin layers in the soil in which it is found, but is so rare in India that it finds a place in the museums at Calcutta. We are informed that there is a similar stone, but not so wide as the one under notice, in the British Museum, and another in the museum of the School of Mines, but specimens are very rarely to be met with. Although the stone has a gritty appearance, no grit or dust is thrown off by the motion given to it when under pressure.

**PRESERVATIVE.**—Charcoal is one of the worst conductors of heat, in consequence of which property it is frequently employed to fill the space left between the inner and outer lining of a properly constructed ice chest. As an illustration of this property we may mention the well known trick of taking immediately from the fire a kettle of boiling water and supporting the same on the naked palm of the hand; to be safe, however, in performing this feat, it is requisite that the bottom of the kettle is well covered with a fair thickness of soot, and that none of the latter is in an ignited state.

**GLAUCUS.**—The Emerald and Beryl are all most identical in composition, the principal constituents being about 65 per cent. of silica, 16 do alumina, and 13 do glucina, the last being a peculiar base; the difference in color proceeding in general in consequence of the former containing the green oxide of chromium, whilst the latter is colored by the protoxide of iron, crysoberyl and a mineral called phenakite also contain glucina, but in a different combination as compared with the above, the former containing seventy-seven per cent alumina and eighteen of glucina, the latter fifty-six of silica and fifty-five of glucina.

THE number of Irish in New York city is estimated in round numbers at 400,000, and of Germans at 200,000.

## Importance of our Iron Interest.

It is but a few years since specimens of Lake Superior iron were handed about and examined with eager curiosity. The locality was too far removed from the great centers of population for such ores to have any value. Furnaces and puddling works were soon built, however, and the enterprise of making iron commenced on a small scale. Coal there was none, and wood was scarce; a few scrubby trees were converted into charcoal for feeding the furnaces. The metal proved to be the best ever produced in the country. In 1855 the St. Mary's canal was opened so that vessels from the lower lakes could enter Lake Superior. It was found that the ore could be shipped cheaper than it could be worked. The shipments of 1855 amounted, in round numbers, to 11,000 tons; in 1860 it had increased to 116,000; in 1863 to 185,000; in 1864 to 235,000; in 1866 it reached 285,000, in addition to about 20,000 tons smelted in the immediate vicinity of the mines.

The mines are from thirty to thirty-five miles distant from any water communication whatever, and much of the ore is taken as far as Buffalo, one thousand miles distant, to be smelted! So important has this business become, that the cities of Detroit, Cleveland, and Buffalo, even, are counting largely on deriving much of their future prosperity from the development of these distant iron mines; their smelters and furnacemen looking to Lake Superior for their supply of ore.

These facts are well worthy the attention of capitalists on this coast, especially in view of the near approach of the completion of the Pacific Railroad, which already passes near what is supposed to be some of the most valuable iron ores in the country, and which is destined to open up a great and growing market for the iron trade, in the illimitable mining territory of the great interior basin between the Rocky Mountains and the Sierra Nevada, to say nothing of this city and State.

The iron interest of this coast cannot fail to become of great value at an early day. Difficulties will no doubt be encountered at the outset, in producing iron on this coast; but, under intelligent management, they ought not to be especially formidable. A good iron mine is worth far more than a mine of either gold or silver. There is much reason to believe that the disabilities under which we have heretofore labored from lack of coal, for this and similar undertakings, on this coast, will soon be done away with, by the substitution of another product which will place us in equally as favorable a position for fuel as are our brethren of the Atlantic States. In this connection we would call especial attention to an article in another column on the use of petroleum in iron manufacture.

What promises to be a fair beginning in the iron business, has already been made in Oregon, where a blast furnace has been erected that turns out twelve tons of pig iron each twenty-four hours. Half a dozen such furnaces could not supply even the present wants of the Pacific Coast, leaving out of the account iron which is now or soon will be demanded for railroad and naval construction. The fascination which has heretofore held our people so firmly to the production of the precious metals alone, is fast giving way to a broader view of our resources, and the grosser metals and agricultural and miscellaneous products will soon prove far broader and more generally lucrative fields of enterprise than the search for gold and silver.

TO MINING COMPANIES.—We would call especial attention of any mining company in need of an experienced and reliable Secretary to attend to their office business, to the notice in another column, headed "Mining Secretary."

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

## The Use of Petroleum in Iron Manufacture.

The value of petroleum for the manufacture of iron and steel, is being developed as rapidly and surely as for the production of steam. It is well known that iron and steel produced by charcoal, are far superior to that made by means of any other kind of fuel, and commands a much higher price in the market. It is in consequence of the absence of sulphur and other impurities from charcoal, that the superiority of that fuel is due. For precisely the same reason petroleum is superior to all other fuels for such work.

According to a late correspondent of the N. Y. Express, petroleum has recently been most successfully applied in New York city, in the manufacture of fine steel for cutting, etc. In the experiments made, the metal is converted in crucibles. The experiments thus far had been conducted in private; but they were soon to be thrown open for public inspection. The combustion of petroleum in this experiment is entirely different from the mode of burning it by Mr. Foote, in his Palos experiments, or that of Mr. White, of this city. The apparatus used in this case is what is known as the "surface burner," on which the oil is allowed to drop, and is consumed at the instant of evaporation. A steam jet is also admitted into the furnace. The process and apparatus is said to be even more simple and cheap than that employed by Mr. Foote, although possibly it might not work as well for making steam.

The writer in the Express says that the petroleum so used produces a most "terrific heat," just the thing required for the purpose, and that the work is done in much less time than it is possible to do with the best of coal. One great advantage claimed, and which is manifest, is the steady and uniform heat obtainable, which cannot be obtained in the use of coal, where there is a necessity for frequent opening of furnace doors, throwing in cold fuel, etc. The disadvantage of suddenly reducing the heat of a converting furnace, say one or two thousand degrees, will readily be understood by any intelligent steel manufacturer. Yet this is unavoidable where coal is employed, and entirely unnecessary in the use of petroleum. A large amount of labor and exposure to great heat is also avoided. The purity and evenness of the heat is found, as might reasonably be expected, to produce a much superior steel to that produced by the best coal in the same furnace. This mode of burning petroleum might doubtless be applied equally well to the blast furnace. Its application to the reverberatory must certainly be especially advantageous and readily accomplished.

The "terrific heat" spoken of by the writer in the Express, tallies well with the report of the experts who recently went down to Santa Cruz to witness the operation of White's petroleum burner, the result of which we have already recorded. They describe the heat as being most intense, for a furnace of that mode of construction, greatly exceeding anything of the kind they ever witnessed from coal in similar furnaces. The rapidity with which steam is generated, from the first firing up, as evidenced in the Santa Cruz furnace, and in the experiments of the Boston Steam Fire Engine, as well as on board the Palos, appear to leave no room to doubt the activity and intensity of the petroleum fire. From all accounts we are unable to resist the conclusion that we are on the eve of a most important revolution in the matter of fuel for furnace purposes of nearly every description. In this contest California bids fair to act a most important part, and reap a rich reward.

AMERICAN EXHIBITORS AT PARIS.—Commissioner Beckwith says that out of 500 American exhibitors at the Paris Exposition, over 300 received premiums.

SHALL WE HAVE AN OBSERVATORY?—In another column will be seen some notice of a private astronomical observatory just erected in Brooklyn, N. Y., and another in contemplation, for the city, in one of her public parks. This reminds us to again ask, Is San Francisco ever to have an observatory? We have in this city a most deserving, active and world-wide known Scientific Society, which is without a home or a place in which to build one. The idea has already been suggested, in private circles, and we venture to make the suggestion publicly, that such a building as would be needed for them, and one which might also be used, in part, for an observatory, might be most advantageously located on the grounds of one of our most central public parks, that is to be—the present Yerba Buena Cemetery. Something in the way of monumental ornament will be needed for such a place, whenever it is laid out and improved. Could a more appropriate monument be raised than such a structure as we have hinted at? We presume the city would have no objections to allowing the liberality of her citizens to show itself in the erection of an appropriate temple of science on these public grounds. Such an institution, under the management of the California Academy of Sciences—who might also act as the custodian of the State geological collections, in addition to their own—would soon take high rank among the learned institutions of the world. A botanical, and perhaps a zoological garden, especially designed for the study of natural history, should be made an adjunct of the enterprise. Such an adjunct, aided by the Academy's collections, which, under certain restrictions, might be thrown open to the public, would afford a most favorable opportunity for that important and useful study.

INDUSTRIAL FAIR FOR 1868.—A meeting of the Executive Committee for the approaching Industrial Exhibition of the Mechanics' Institute, was held last evening, when the following sub-committees were appointed:

Finance.—Messrs. Boheu, Coffran and Plum.

Building and Sites.—Messrs. Nunan, Elliott, Harrison, O'Conner and Macdonald.

Circulars and Address.—Messrs. Harrison, Pritchard and Williams.

Printing.—Messrs. Dunn, Corcoran and Pease.

Machinery for Building.—Messrs. Spiers, Hanscom and Austin.

Premiums.—Messrs. Macdonald, Lewis, Tilden, Plum and Spiers.

Classification.—Messrs. Rosekrans, Elliott, Young, Mosheimer, Dunn, Pritchard and Pease.

Rules and Regulations.—Messrs. O'Conner, Lewis, Rosekrans, Corcoran and Coleman.

Application from Legislature.—Messrs. Williams, Young and Nunan.

THE COLORADO MINERAL EXHIBITION.—Mr. Geo. O. Whitney, of this city, brother of the Colorado Commissioner to the Paris Exposition, has placed upon our table a copy of the finely executed London edition of the pamphlet which Commissioner J. P. Whitney had printed in Paris, containing a schedule of the ores exhibited, with information about the Colorado region and its resources, etc. An elegant map of the United States, and a separate one of Colorado Territory is also given. The elegant reprint of this work in London affords a very good evidence of the appreciation in which reliable information from this quarter of the world is held in that great commercial emporium.

OUR PARIS LETTER, for next week, will give some facts with regard to the California wines at the Paris Exposition. "Somebody has blundered" in that matter; not our correspondent, however, for he has done everything that lay in his power to advance the interests of the California exhibitors. The series of letters which he is writing are the best that we have seen from the Exposition, whether published on the Atlantic or Pacific side. The entire series will comprise from twelve to fifteen numbers. We have three now on hand, not yet published. They will appear each week successively until the series is concluded.

**New Patents and Inventions.**

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

**RECENT INVENTIONS.**

**JOHNSON'S NEW SAFETY CLUTCH.**—Mr. J. B. Johnson, of this city, has invented what he calls a "Roller Safety Clutch," which may be adjusted to any hoisting gear; and by the use of which, while the platform or any other weight can be safely and readily hoisted by any of the ordinary means, there is no possibility of its slipping back. It can be held at any desired point. A simple attachment places the clutch under the control of any one who may be attending the machinery. By simply pulling a light string the clutch is raised, and the platform will descend; but the very instant the tension on the cord is removed, that instant the platform or other weight being lowered, stops. There are no cogs or friction gear about the invention. It operates with rollers so arranged as to give an absolute and certain check—the weight not being able to drop over an eighth of an inch after the clutch is applied. The clutch is extremely simple, and can scarcely, by any possibility get out of order, and will never wear out except by decay or decomposition of the material of which it is made. The invention is decidedly original, and of much merit. Mr. Johnson has a working model of his invention at the office of H. F. Williams & Co., 405 California street, near Sansome, where all interested are invited to call and examine it. Application for a patent has been made through the MINING AND SCIENTIFIC PRESS, PATENT AGENCY.

**APPLICATION FOR RE-ISSUE.**

**HARVESTING MACHINE.**—David J. Marvin, Stockton, Cal. P. Nov. 15, 1864. P. Sept. 9, 1867:

1st, In a combined header and thrasher, I claim so pivoting or hinging the cutter-frame upon main axle, a, that it can be moved longitudinally, and also raised or lowered at pleasure, substantially as and for the purpose specified.

2d, In a combined header and thrasher, having its cutter-frame mounted or hinged as above described, I claim the combination and arrangement of the bar, a', posts, b', b', pulley, d', cord, c', and crank-rod, N, substantially as and for the purpose herein set forth.

3d, In a combined header and thrasher, I claim the arrangement of the cutter-bar and apron, Q, running crosswise of the machine in combination with the arrangement of the thrashing and winnowing apparatus running lengthwise of the machine for the purpose of greater convenience and compactness and in the manner substantially as shown.

4th, In a combined header and thrasher, I claim elongating the axle, a, so as to place the wheel, O, at a considerable distance from the main-frame of the machine, to afford room for the attachment of the header-frame between said wheel and main frame.

5th, The combination of the levers, i and l, with the sliding header frame and the gear-wheels, c and b, for the purpose of throwing the header apparatus into and out of gear, substantially as shown and described.

6th, The swinging axle, a, in combination with the gear-wheel, b', pinion, Q, and lever, A, for throwing the thrashing apparatus into and out of gear, substantially as described.

**PATENTS RECENTLY ISSUED.**

69,152. — CARPET-CLEANER. — George W. Young, assignor to George W. Smith, San Francisco, Cal.:

I claim the whips in combination with the beaters, as shown and set forth.

I also claim the combination of the combined whip-beaters with the brushes, D, D, according to arrangements above described, and for the purposes above specified.

**NEWSPAPERIAL.**—We understand that the *Mercuriale Gazette and Prices Current* has been purchased by the proprietors of the *Commercial Herald and Market Review*, and the former will be merged with the latter. Under the editorial management of H. C. Beals, the *Herald* has been a success from its inception.

"You may talk to me of Baltimore and Philadelphia and New York, and their railroads and the trade of the Atlantic—let me tell you that the Pacific Coast is already beginning to revolutionize the world!"—*Speech of Hon. Wm. H. Secured to the people of Sanapalis, Maryland, June, 1867.*

**ADDRESS**

*To the Permanent Citizens of the Pacific States and Territories.*

**Citizens.**—We enjoy the finest country that the sun shines on, the most varied and fertile soil, the most extensive seaboard, and the greatest breadth of land having the richest metallic deposits possessed by any one nation of the earth, a land affording all the most varied material for manufactures, wool, hides, cotton, silk, metals, coal, flax, gums, wood, and, above all, abundance of every kind of food.

We are only a million of people, and yet have more land and sea than Russia with sixty millions—more land than France and Germany, with their hundred millions of people. In the face of those vast resources, there are towns crumbling to decay, men seeking without finding employment. Something wrong here, or this would not be happening. Let us consider.

The instructed mind of the population is mostly devoted to political office-seeking. Their ambition is misdirected. The rising youth is trained to idleness. This mode of thinking and training must be reversed if we would hold this magnificent country against the incoming barbarians.

We must teach our youth the glories of manufactures, of commerce, of industry. We must nourish every effort, however rude, at manufacturing what we require. By devoting some of our capital and our young people to manufacturing and general industries we shall soon become busy, get rich, bring more and more people into the country, create new wants, build up new villages around them; cultivate more land, build more ships, generate more commerce, and thereby create profitable employment for all who want work.

Now, fellow citizens, some money capital is required to help on this industrial movement. Where shall we get it? There is a considerable fund which we may divert from its present bed and channel, viz: the Insurance Fund.

Consider. The people of the Pacific States pay two hundred thousand dollars a month to the Insurance Companies for assuring them against losses from fire and shipwreck.

There are some fifteen of those Insurance offices in this city, each fishing for its share of this large fund. Each office pays a heavy rent, a half dozen employees and clerks, besides printing and advertising; the lowest cost is a thousand dollars a month on each office, and with some it is double that. There are too many persons employed in the business; too much dozing over newspapers; too much red tape and circumlocution; too high salaries and too little work. Think of two hundred thousand dollars a month! two millions and a half a year! paid to those sleepy gentlemen for what little they do. This must be reformed. Three or four Insurance offices are quite enough for the million of scattered inhabitants of the Pacific States. A dozen of them may be abolished with great benefit to the community; some one or two have already withdrawn.

This change would liberate some fifty men of education, whose business capacity would be of much greater service to the community in other branches of industry, such as manufactures, agriculture, commerce, the fisheries, the forests and the mines. This change would also divert a million or two of dollars to other and more useful industries, whereby a thousand fold more of national capital and employment would be generated than by the present drovny system.

The managers of the Builders' Insurance propose, with the co-operation of the people, that this vast monthly stream of wealth shall be arrested and diverted to the aid of home manufactures, to effect a great reform and remove from the people's shoulders the expense of supporting a small army of insurance clerks and agents. The Builders' Insurance Company has passed through its first year (the most trying) with singular success. It has gathered a hundred thousand dollars, paid promptly all its losses, and established a business income of fully twenty thousand dollars a month! This has been done while we were yet but an experiment, and enjoying the confidence of only a portion of the public. We now appeal to the entire people. We ask them to send their Insurance business to us on the following conditions, and soon we shall have an income of ONE HUNDRED THOUSAND DOLLARS A MONTH, and here is what we shall do with the money.

First, We calculate, from our past experience, that we shall lose by fire and marine disasters half our monthly income (as our first year's experience our losses were but one-third of our income).

Suppose, then, that our income shall be worked up to one hundred thousand dollars a month, and suppose that we shall pay out losses to the extent of fifty thousand dollars a month, we shall still have fifty thousand dollars a month to bank up, (or half a million a year.) We propose to make two parts of this sum—one part (a quarter of a million a year) to be invested in City Bonds, to protect the assured, and one part (about a quarter of a million a year) we propose to convert into a

**MANUFACTURERS' LOAN FUND,**

Which shall be lent exclusively to manufacturers on mortgage of their premises and machinery, at as low rate of interest and on as long time as is generally current on real estate.

By the aid of this fund the budding industries of the Pacific States may be nourished into active life; more and varied employments can be originated for the people; immigration may be welcomed and not feared; the farmer will have got a market at his own door for the produce of his land; the manufacturer will find a lively home demand from the farmer for the products of his millchutes.

All this, good people, can be achieved, by your own votes at your own elections, without the aid of Congress or the Legis-

lature—it is simply to vote that your Insurance shall go to the Builders', by which vote you shall enable us to plant factories all over the country. You shall fill the rivers and harbors with busy ships; you shall send out upon the distant waves fishing expeditions that will bring back wealth to your cities; you shall form a nursery of seamen around your own shores—the ova of a future commerce and a protective navy; you will create the hum of busy workmen in every desirable locality on the Pacific Coast; you will bring from neglected fields produce of the utmost value; all of which will most certainly multiply a thousand fold the wealth of the country in which your lot is cast, making a worthy home for yourself and a future country for your offspring.

People of the Pacific States and Territories! We pledge ourselves to you to effect, with your co-operation, some of those things. We have kept all our pledges so far, and have uttered nothing that was not true. Already have we helped to move the shuttle and the loom, which others, with more means, have passed by and neglected. Already have we helped to build and rig ships in our own dock-yards, and seen our own waves in search of riches for the city. Already have we given many liberal bounties and donations to the deserving institutions of the city. Give your vote to the Builders', and we shall share its profits with every useful charity and every honest industry, and help along every enterprise that promises benefit to the people.

We call for the yeas and nays.

THOMAS MOONEY, President.

EDWARD MACCANN,

WM. B. COOKE,

W. G. WEIR,

J. D. CONNELL,

J. W. McCORMICK,

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, con templates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. LOTT, Secretary. Office, 305 Montgomery street, corner of Plac, San Francisco. 2v15

**JACOB SNEW, Pioneer Photographer,** 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14tf

**SECRETARSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15tf

**FOR CABINET PHOTOGRAPHS, or Enameled Cards,** of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street. Every picture war ranted to give perfect satisfaction. 5v15qr

E. F. HOWLAND, Artist.

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. SEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler—repairs alone.

One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-ly

AUSTIN A. WELLS, Agent.

**NORTH AMERICA**

**Life Insurance Company.**

Usual Restrictions on Occupation and Travel

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company a the World!

**J. A. EATON & CO.,**

Managers Pacific Branch, 302 Montgomery st. 20v14n9p

**Mining Secretary.**

**THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.**

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON, 17v15-tf No. 5 Government House, San Francisco.

**Boiler Makers Wanted.**

**WANTED—GOOD BOILER MAKERS,** (THAT ARE NOT Society men) to whom steady employment will be given. Apply to COFFEY & RISDON, Boiler Works, Sush and Market streets. 13v15-1w

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 10v14n9qr

**Perry Davis' Vegetable Pain Killer.**

This medicine has relieved more pain, and caused more real joy than any other one thing that can be named. It is a "balm for every wound." Our first physicians use it, and recommend its use; the apothecary finds it the first among the medicines called for, and the wholesale druggist considers it the leading article in his trade. All the dealers in medicine speak alike in its favor, and its reputation as a medicine of great merit and virtue is fully and permanently established, and it is the "Great Family Medicine of the Age."

Prices, 25 cents, 50 cents, and \$1 per bottle.  
Sold by all Druggists, Grocers and Medicine Dealer everywhere. 15v15-1m

LEWIS FALKENAU. HENRY G. HANKS.

**Pacific Chemical Works,**

Laboratory, Sixteenth street, near Folsom. Office, 623 Montgomery street, San Francisco.

**FALKENAU & HANKS, MANUFACTURING AND CONSULTING CHEMISTS.**

Particular attention given to the analysis of Ores, Minerals, Metallurgical Products, Mineral Waters, Soda, Commercial Articles, etc. 14v15

**BOILERS.** Locomotive, Flat, Tubular, Upright, Cylinder and Corairish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russell Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH, GEO. W. PRESCOTT, IRVING M. SCOTT  
24112 H. J. BOOTH & CO.

**MINING INTELLIGENCE.**—The following mining news from the north is crowded out from its regular place in the Summary:

Dalles *Mountaineer*, Oct. 5th: The miners at Cañon City are all doing well, and money is plenty.

The miners on Dixie Creek are doing extremely well. A number of claims have changed hands. Last week one claim was sold to Chinamen for \$2,500 cash. Several other trades are about being made with other Chinese companies.

The balance of the prospecting company were met near Camp Watson en route for home. They report having found very good prospects on Beaver Creek, a small branch of Crooked river.

The Vancouver *Register* says: It is reported that rich diggings have been struck in the Yakama country, about 60 miles from this place. A gulch has been discovered about seven miles long, which yields from 5 to 25 cts. to the pan. Some 40 men are now at work. A number of our citizens started yesterday for that region. In addition to the above, we learn that the mines, so far as discovered, are located very near the summit of the Cascade, so high up that even now there is snow in abundance.

The learned blacksmith, Burnett, has returned to his native New Britain, Conn., where he intends to remain until the end of his erudite existence.

**Machinists and Foundries.**

**PALMER, KNOX & CO.,**  
**Golden State Iron Works,**

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.  
25v12-3m

**INTERESTING EXPERIMENTS ON THE SENSITIVE PLANT.**—The experiments on the sensitive plant, conducted by M. Bert, have been taken up by M. Ch. Blondeau, who has tested the leaves with the induced galvanic current of a Ruhmkorff's coil. He submitted three plants to the influence of the electric current. The first was operated on for five minutes; the plant when left to itself seem prostrate, but after a while—a quarter of an hour—the leaves opened, and it seemed to recover itself. The second was acted on for ten minutes. This specimen was prostrate for an hour, after which it slowly recovered. The third specimen was galvanized for twenty-five minutes, but it never recovered, and in twenty-four hours had the appearance of a plant struck by lightning. A fourth plant was etherized and then exposed to the current. Strange to say, the latter had not any effect; the leaves remained straight and open, thus proving, says M. Blondeau, that the mode of contraction of the leaves of the sensitive plant is in some way allied to the muscular contraction of animals.

An American has invented a novel sort of programme for the French theatres. The paper of the playbill is represented by a light agreeable crust of pastry, and the ink is chocolate paste. The advantage of the invention is, that when the spectator has mastered the contents of his bill he eats it.

**Mechanical Drawings.**

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

**Assayer and Chemist.**

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office.

**WHITING & BERRY,**  
No. 609 Sacramento street, two doors above Montgomery,  
SAN FRANCISCO.

**TEA, WINE AND SPIRIT MERCHANTS,**  
IMPORTERS AND WHOLESALE DEALERS IN FINE  
Brandies, Whiskies, Gins, Port, Sherry and Champagne  
Wines, Ale, Porter, Cider, Bitters, Cordials, Syrups, etc.,  
for medicinal and family use, and suppliers to families,  
apothecaries, physicians, city and country dealers, hotels,  
clubs, etc. In large or small quantities.  
Observe firm name on each cork and fac simile of signature  
on label. Trade mark registered.

This is the only exclusive Tea, Wine and Spirit Store on  
the Pacific coast. It is neither a saloon nor sample room  
(as no wines or spirits are allowed to be drunk on the premises),  
but a depot where selected Teas and Pure Wines and  
Spirits may be found, at wholesale and retail, for medicinal  
and family use. In this respect it is our aim to vie with  
Blümling & Co., of New York, Ridlow & Davis, of London,  
and Cozzens & Co., of Washington, where every facility is  
offered to ladies, as well as to gentlemen, in making their  
own selections and purchases in quantities to suit. Our  
Treatise on Wines, Spirits and Teas may be had at our  
depot gratis, and will be mailed to consumers and dealers  
in the interior when requested.

**THE PACIFIC IRON WORKS,**

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryon Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press PATENT AGENCY has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

**FIRST  
Paint Manufactory  
IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture, set and use

**Ellery's Patent India Rubber Cement & Paint.**  
It is for all exposed surfaces; Impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. The coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlant C Lead Works use our Paint only.

A FEW CLOTH ROOFS put on; copious and all seems renovated and saturated, they coated with the India Rubber Cement and Paint—the same as on the St Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamships, etc., around New York—for eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS renovated and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. E. D. Cogswell, Truitt & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis's building, 88 feet front, on Folson street, between Third and Fourth streets—only one cent. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one cent. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums, dissolved in laseed oil, mixed with the various coloring matters and ground in any color. When applied to roofs or other purposes, it is mixed with pure laseed oil to the required thickness, and put on as other paints are with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used.  
Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUPPLIES, AIDS and CHEMICALS, can be had on hand. San Francisco March 6, 1865. 11v10-1f

To the People Of the Pacific States, And Especially those Engaged in Mining.

Gold is the attractive element which has brought more than half a million people to this coast. Every one who comes here wishes to have his share out of Nature's treasure box as quick as possible. The laws of the land are liberal. They say you are welcome to all the gold you can find or dig out, and it depends only on you to know or to learn how to do it. That our mines are rich beyond calculation, is plainly proven by the thirty millions of gold we annually produce, and which is still on the increase, in spite of the many failures and the imperfect mode of working by which more than fifty per cent. of the precious metals is lost. The days of placer mining—where only physical strength was required—are gone, and we have now to resort to Practical Chemistry and Metallurgy for working the ores of our mines. Not every miner can be a Chemist and Metallurgist, as such an acquirement requires years of study; but what they want, and what pretty effectually meets the case, is a place where, in a few lessons, they can obtain a practical knowledge of how to treat certain classes of ore; and for this purpose, to make mining in the future more reliable, safe and profitable. With this end in view, I have endeavored to bring within the reach of every one the necessary practical knowledge of how to be successful in mining; and for this purpose I have now established the first and only PRACTICAL METALLURGICAL AND MINING SCHOOL in the United States, where gentlemen can obtain more in a few practical lessons than by years of book study without practice. I have also the only METALLURGICAL WORKS in California, where I undertake to assay and work ores of every description. Many eminent gentlemen have, within the past year, taken lessons and graduated from my establishment, and all of them will bear testimony that they were perfectly satisfied with the amount of information they obtained, and that it was so obtained in half the time they expected. For further particulars apply at my office, 323 Montgomery street, San Francisco. J. MOSHEIMER. 6v15-1f

MOSHEIMER'S PIONEER MINING SCHOOL -AND- Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches: 1. Assaying of ores, metals and other mineral substances. 2. Technology, or Chemistry, as applied to any special branch of manufacturing. 3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5. Concentration. Dressing of ores. 6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology. Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore, learn first, if you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful. It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufactories carried on my own account, have not only given me lessons, but more than ordinary ability. I was the first one in California who successfully extracted silver by smelting on a large scale, and have since been traveling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process. I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of work. My lately invented Roasting Furnace has the following advantages: A Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurates. The total expenses of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine or other gas which is used in amalgamating. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores.....\$3 00 Copper ores..... 5 00 Practical Chemist, Metallurgist, Etc. Office, No. 323 Montgomery street, San Francisco, Cal. 6v15-3ms

Professional Cards.

SHERMAN DAY, Mining Engineer, No. 114 Montgomery Block, San Francisco. Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or the machinery management and expenditures of mines. 22q

FREDERICK MANSELL, Mechanical & Architectural Draughtsman, No. 422 California street, corner of Leidesdorff. Drawings of Models made for parties applying for patents at Washington or London. mar23-1f

ISAAC LOBREE & CO., GOLDEN STATE POTTERY, ANTIOCH, CAL. Office in San Francisco, 516 Commercial st. Constantly on hand a large assortment of Earthenware, Fire Bricks, Fire Clay, and Stoneware. Is prepared to fulfill all orders at the shortest notice. 20v14f

J. W. WINTER, DENTIST. Office, 647 Clay street.....San Francisco. First-class gold fillings for \$3, as good as any dentist can produce in the city. Dr. Winter has practiced Dentistry twenty years—fifteen in this State. For a full upper set of gum teeth, on vulcanite base, from \$20 to \$35. Teeth extracted without pain by local application. 18v14-1f

RADICAL CURE -OF- RUPTURE! Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process. 624 Washington street, up stairs, Washington Baths building, between Montgomery and Kearny streets. DR. A. FOLLEAU Has his studios and manufactories in the same building. Every kind of Apparatus, Trusses, Orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself. He has no connection with any Agency. 21v14-11p1f

Blanks, Blank Mining Books, Constitution and By-Laws -FOR- Mining and Prospecting Companies Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press. Orders from the Interior faithfully attended to.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation and a large mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all the machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Frodo Union.

New Mining Advertisements.

Cordillera Gold and Silver Mining Company, Chihuahua, Morelos Mining District, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of October, 1867, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary. Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. HENRY R. REED, Secretary. Office, 321 Washington street, San Francisco, Cal. oc26

Chilpaneca Mining Company—District of Ures, Sonora, Mexico. By order of the Board of Trustees.

H. B. CONGDON, Secretary. Office, No. 620 Washington street, (Room 5) San Francisco, Cal. oc5

George Washington Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of September, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Name, No. Certificate, No. Shares, Amount. Lists shareholders like Borel, Francois Ami, Borel, Francois Ami, etc.

And in accordance with law, and an order of the Board of Trustees, made on the sixth day of September, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at No. 327 Montgomery street, San Francisco, Cal., on Thursday, the thirty-first day of October, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary. Office, 331 Montgomery street, San Francisco. oc12

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1867, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, George H. Faulkner, No. 423 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the twenty-second day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. oc21

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until Wednesday, the 20th day of November, 1867, and the sale thereof until Saturday, the 7th day of December, 1867. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. oc28

Table with columns: Name, No. Certificate, No. Shares, Amount. Lists shareholders like Swain, D. K., Tanner, M. C., Vann, Matthew, etc.

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of September, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, 418 Montgomery street, San Francisco, Cal., on Monday, the fourth day of November, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. O. WOOD, Secretary. Office, 338 Montgomery street, San Francisco. oc19

George Washington Gold and Silver Mining Company.—Silver Mountain District, Alpine County, Cal.

Notice.—The Fifth Annual Meeting of the stockholders of the above named Company will be held at their office, No. 338 Montgomery street, San Francisco, Cal., on TUESDAY, the fifth day of November, 1867, at 7 o'clock P. M. for the purpose of electing Trustees to serve for the ensuing year, and for the transaction of such other business as may properly come before them.

A. O. WOOD, Secretary. San Francisco, October 10, 1867. oc12

Great Central Mining Company.—Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of September, 1867, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, or at the Pacific Bank.

Any stock upon which said assessment shall remain unpaid on the fourth day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary. Office, No. 302 Montgomery street. oc5

Hope Gravel Mining Company.—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of September, 1867, an assessment (No. 17) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 533 Kearny street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eleventh day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary. Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. oc5

I. X. L. Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of September, 1867, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, near Jackson, San Francisco, or to John G. Slaven, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fourth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNSHIELD, Secretary. Office, Pioneer Hall, Montgomery street, upstairs, San Francisco. sep28

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until Monday, the fourth day of November, 1867, and the sale thereof until Thursday, the twenty-first day of November, 1867. By order of the Board of Trustees.

J. CROWNSHIELD, Secretary. oc25

Mount Teabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the sixth day of September, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Name, No. Certificate, No. Shares, Amount. Lists shareholders like Borel, Francois Ami, Borel, Francois Ami, etc.

And in accordance with law, and an order of the Board of Trustees, made on the sixth day of September, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at No. 327 Montgomery street, San Francisco, Cal., on Thursday, the thirty-first day of October, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary. Office, 331 Montgomery street, San Francisco. oc12

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1867, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, George H. Faulkner, No. 423 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the twenty-second day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. oc21

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until Wednesday, the 20th day of November, 1867, and the sale thereof until Saturday, the 7th day of December, 1867. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. oc28

Oxford Beta Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1867, an assessment (No. 24) of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine. Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. oc14

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until the first day of November, 1867, and the sale thereof until Monday, the eighteenth day of November, 1867. By order of the Board of Trustees.

GEO. H. PECK, Secretary. oc26

Old Colony Silver Mining Company.—Location of Works: Austin, Reese River, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of September, 1867, an assessment of three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 523 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the second day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY O. HOWARD, Secretary. Office, 523 Montgomery street, San Francisco. oc5

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of October, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 318 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISEL, Secretary. Office, 318 California street, San Francisco, Cal. oc19

Whitman Gold and Silver Mining Company, Location of Works: Indian Springs District, Lyon County, Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifth day of September, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Name, No. Certificate, No. Shares, Amount. Lists shareholders like Ainsworth, J. C., Alexander, Henry M., Atkinson, J. H., Brewster & Baldwin, etc.

Any stock upon which said assessment shall remain unpaid on the sixth day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

Machinery.

**VARNEY'S PATENT AMALGAMATOR.**

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco.

**Hunt's Double-Action Pump**

Is cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second street, and 103 Jessie street. 14151st

Beale Street, San Francisco.] 23v12 3in

**PATTINSON'S**

**HURDY-GURDY WATER-WHEEL.**

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15-97

**THOMAS PATTINSON,**

**Brodie's Patented Improvements**

**FOR THE TREATMENT OF Gold and Silver Ores.**

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.**

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

- No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price . . . \$600
- No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour . . . 850
- No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour . . . 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient light to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1865. JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**

This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be accorded on application to the subscribers. Those infringing the patent rights to the above improved Barrel, are hereby informed on and after the 1st of November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**

This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 1865.

**BRODIE & READLIE,** Express Building, 402 Montgomery street, San Francisco. 12v131st

**LEFFEL'S American Double Turbine**

THESE WHEELS, UNEQUALED AND UNRIVALED in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA RESIDENCES.—E. Stockton, Folsom; O. Simmons, Oakland (Mill at Clear Lake); Morton Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular to KNAPP & GRANT, Agents for California, 310 Washington street, San Francisco. 25v13-1yq

**E. O. HUNT,** Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person. HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State. Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 28 Second St., and 108 and 110 Jessie St. San Francisco. 2v15qy

**PICKERING'S ENGINE REGULATOR.**

Warranted the Best in Existence. Cheap and easy to attach to any Engine, old or new. Send for a Circular, to DAVID STODDART, 114 Beale street, San Francisco. 12v15-2am1q

**SUPERIOR CUT-OFF ENGINES.**

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

**Hartford Engine,** With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

**Fuel-Saving Engine,** Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

**GODDARD & CO.,** Pacific Iron Works, 9v151st, San Francisco, Aug. 29, 1867.

**DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.**

THE ATTENTION OF QUARTZ, HYDRAULIC AND Pincer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15 6m

**BLAKE'S QUARTZ BREAKER! PRICES REDUCED!**

MACHINES OF ALL SIZES FOR SALE —BY— **WM. P. BLAKE,** Corner First and Mission streets, or Box 2,077 3v13f SAN FRANCISCO.

**Notice to Miners, Well-Borers and Water Companies.**

M. PRAG IS NOW PREPARED TO MANUFACTURE M. Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

[From our Travelling Correspondent.] **Mining in Nevada County.**

WASHINGTON, contrary to the expectation of some, is being rebuilt; some fifteen new buildings are approaching completion, and will be finished in time for the coming winter. Several claims on Rocky Bar, one half mile above town, are paying excellently. Among the first is the Rocky Bar, J. D. Haroun & Co. These diggings are working virgin ground—one of the bars of the South Yuba, and gathering a quality of gold seldom seen since early times.

EUREKA SOUTH, or Graniteville.—If cheerful countenances have anything to do with favorably impressing a stranger, the inhabitants of this district clearly show (as their name implies) that they "have found it." Gold bearing quartz does certainly exist here in abundance, showing a width and richness of vein equal to that of any district in the county. True, the lodes as yet are undeveloped, but, as far as demonstrated, the indications improve as the ledges are opened. Several are now down to the depth of from one to two hundred feet.

The Grizzly, (Eagle Co., Hartford, Ct.) Mr. M. Foot, mining superintendent, is located at the head of Devil's cañon, four miles from Eureka, and twenty-four from Nevada City. This company's mine comprises a line of nearly 3,000 feet, with a width of vein varying from two to five feet, and imbedded in a soft clay formation on either side, giving ample room for working without having to blast or remove any of the primitive slate. Two levels are now run; the upper one is in one hundred and fifty feet; the lower, three hundred and eighty. The ore improves as they go down, showing more free metal and less iron. The yield, so far, averages \$12 per ton; but they evidently do not save near all the gold. At present they are only running a 5-stamp battery (hurdy-gurdy power.) The whole expense of motive power does not exceed four dollars per day.

Birchville, Thompson, Hyde & Co., is a very rich vein, of from two to three feet in width, showing considerable free metal in nearly all the ore, and frequently rich in specimens. The company have run a tunnel in on the ledge several hundred feet, showing their mine to be of sufficient extent and richness to warrant the erection of a 5-stamp mill, which, by the way, they expect to have in operation before this is in type.

Commercial, Valentine Co., San Francisco. This mine is tapped at a right angles, by means of a tunnel 150 feet in length, striking the ledge about the same distance from the surface. From the main tunnel they have run in on the vein each way, showing a well defined lode of about eighteen inches in width. The ore has a fine appearance, and will doubtless pay if properly worked. The company have just started their new 10-stamp mill, built by Booth & Co., of San Francisco. They also have three of Hendy's patent concentrators. Appearances are that this mine and mill will continue to be conducted in a neat and systematic manner, by one of its proprietors, Mr. Valentine. Success to his efforts.

The Black & Young, named from its respective owners, has before been alluded to as a mine of undoubted value, a portion of it having been recently sold for \$20,000. This company have a fine mill, running a portion of the time on custom work, while they are opening their own mine, the ore of which presents an excellent appearance, [described last week in "Contributions for our Cabinet."—EDS PRESS.]

The Banberry, or Rocky Glen Ledge, owned by Banberry, Stacy & Co., is situated about one fourth of a mile above Black & Young's mill, and one and a half mile from town. This is considered by many to be a little ahead of anything yet discovered in the district; although indications are highly favorable, yet it is in a manner undeveloped. The vein is evidently a large one—six feet or more—and improves in appearance as

they go down. They have made a test at Black & Young's mill of a considerable quantity of rock, which yielded \$18 per ton, and are now making another test of 100 tons, which, it is believed, will produce equally as well, if not better.

There are several other prominent ledges in the immediate neighborhood of Black & Young's mill, owned by a distinguished German citizen, who, through modesty, declines a mention of his name; but in the estimation of the writer, it is only a matter of time—he will either have to show himself, or make a disposal of mines too valuable to remain unknown.

The Norfolk, Passmore, Booth & Co., apparently have a good ledge, of good width and quality of ore, showing a large proportion of sulphurets, and some free gold. They are down with an incline about fifty feet, displaying as clearly defined a vein as could be desired. As work progresses and tests are made, we hope to be made acquainted with the results.

The Liberty Ledge, Dean, Stevens & Co., is situated close to town. It is a large vein, considerably developed, showing a very good grade of ore, and is paying very satisfactorily by assay test. This, and the Maggie, Clark & Co., is in litigation. The case will probably be disposed of (settled) very soon, when more will be said of the mine.

D. W. Snapp, proprietor of several valuable leads, some of which are exceedingly rich, offers fine inducements to millmen to obtain part or whole interests in some first class quartz—interests well worthy of examination by practical men.

While the writer was in town, some considerable excitement was caused by a recent discovery of a large ledge near town, by a Mr. Cochran, from Reese River. Said discovery, from its location, is supposed to have been the feeder of a very rich placer claim immediately below it, which is reputed to have produced nearly \$200,000. The lode is not sufficiently uncovered, as yet, to form anything like a correct opinion. Mr. C. will doubtless post us a little in a very short time.

One important point to be observed in this district, is that of the general formation, which is a soft granite, easily worked, requiring little or no blasting—many of the tunnels and shafts having been worked without any blast whatever.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

THE SEVENTEENTH ANNUAL SESSION of this College will commence on August 23, 1867. TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Buths, etc, per session of ten months, \$350.

The Commercial Herald AND MARKET REVIEW Will be issued early on EVERY STEAMER-DAY MORNING, (TRI-MONTHLY). Office—Southwest corner Washington and Battery streets, Opposite Post Office and Custom House.

The Letter Sheet Market Review, Containing selections from the COMMERCIAL HERALD, printed on tissue paper, for transmission abroad, will be published simultaneously with that paper. Also, publication office of the

Weekly Stock Circular. Merchants can have their cards prominently inserted in the Letter Sheet MARKET REVIEW.

THE CENTRAL PARK OF THE PACIFIC. Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, ZOOLOGICAL GARDENS.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast. The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic.

THE RUSSIAN-AMERICAN TELEGRAPH is now constructed to within one hundred miles of Sitka. It is to be hoped that the national Government will offer sufficient inducements to the company to complete it to that city, since that region has become a part of Uncle Samuel's dominions. A telegraphic communication with our new possessions on the North, in the present state of commercial progress, must be looked upon as one of the necessities of the times. It may not pay, as yet, as a commercial speculation; but its existence must be very important to the Government, and should be aided by it until it is capable of taking care of itself. We understand that steps are being taken to secure the completion of the telegraph to the point indicated, by either the company or the Government itself.

THE present Duke of Wellington is printing all of his father's papers—for safety, not for publication. The Duke puts everything into type, and then strikes out such passages as affect living persons too closely, or such as it might be indiscreet to make public. Three copies only of the original impression are taken.

JAY COOKE is said to have made over twelve million dollars profits out of Government securities during the war. He pays no taxes on this amount, but draws as interest in gold each year eight hundred and forty thousand dollars! Quite a little contribution from the tax payers of America.

THE Great Western Railway Company are making successful experiments with peat for locomotive fuel.

MINING AND SCIENTIFIC PRESS.

Terms of Advertising and Subscription.

Table with columns for advertising rates (e.g., One week, per square, \$1.50) and subscription rates (e.g., One copy, one year, \$5.00).

THE CIRCULATION of the Press, already extensive, is rapidly increasing, and substantial tradesmen who can profit by widely disseminating information of their business amongst the most intelligent, ordinary and industrial classes of the Pacific States and Territories will find no more effective or economical medium for advertising.

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE PULSON STREET WEAR, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK. On the 10th, 18th and 30th of each month that has 30 days. On the 10th, 19th and 30th of each month that has 31 days.

HANSBROW'S CHALLENGE Deep-Well, Mining and Double-Cylinder Patent Pumps.

Six-Inch Mining Pump. These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents, LOCKE & MONTAGUE, 112 and 114 Battery Street, San Francisco.

DEWEY & CO. PATENT AGENTS, ENGRAVERS AND PUBLISHERS, Mining & Scientific Press. SAN FRANCISCO.

MINING COMPANIES Can get their Printing done cheaper and better by TRUESELLE, DEWEY & CO., Than at any printing establishment in the city.

COUNTY OFFICERS Can get their Blank Books and Blanks cheaper of TRUESELLE, DEWEY & CO., Than of any other printing house in the city.

MERCHANTS When you want Printing done cheap, send to TRUESELLE, DEWEY & CO., Who do all kinds of Printing at the lowest rates.

FOUNDRIES Will save money by having their printing done by TRUESELLE, DEWEY & CO., Who have put prices down to the lowest rates.

EVERYBODY Who wishes to save money and get good work, see TRUESELLE, DEWEY & CO., Who are always ready to receive and fill orders.

MANUFACTURERS Can get their Printing well done at low prices, by TRUESELLE, DEWEY & CO., Who are now prepared for all kinds of Printing.

TRUESELLE, DEWEY & CO. BOOK AND JOB PRINTERS, MINING & SCIENTIFIC PRESS OFFICE 505 CLAY STREET, SAN FRANCISCO.

BEAN'S HISTORY AND DIRECTORY OF NEVADA COUNTY, CALIFORNIA.

Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources. COMPILED BY EDWIN F. BEAN. Price, \$5.—For sale at the office of the Mining and Scientific Press, San Francisco.

IN THE PROBATE COURT OF THE CITY AND COUNTY of San Francisco, State of California—in the matter of the Estate of HENRY GANAHL, deceased. Order to show cause why Order of Sale of Real Estate should not be made.

NOTICE TO CREDITORS.—IN THE PROBATE Court of the City and County of San Francisco, State of California. Estate of HENRY GANAHL, deceased.

CHICKERING & SONS' PIANOS Received the FIRST PREMIUM (Gold Medal) And Decoration of Legion of Honor, at the Paris Exposition. KOHLER, CHASE & CO., Agents, 254 1/2 Montgomery street, San Francisco.

W. T. GARRATT, City BRASS AND BELL FOUNDER.

Cor. Mission and Fremont sts., SAN FRANCISCO. Manufacturer of Brass, Zinc, and Anti-Friction or Babbitt Metal Castings; CHURCH AND STEAMBOAT BELLS, TAVERN AND HAND BELLS AND GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS, Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spouts, Solder, and Copper Rivets, &c. Oango Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES AND NOZZELS For Mining purposes, Iron Steam Pipe furnished with Fit flanges, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Table with columns for magazine subscriptions (e.g., Harpers, Atlantic, Godey) and a list of news dealers (e.g., W. E. Loomis, News Dealer).

Foundry for Sale. A One-half Interest in the UNION IRON WORKS, SACRAMENTO.

Owned by William R. Williams, is offered for sale on the most favorable terms.

A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

THE BEST IN AMERICA.

The Mining and Scientific Press, is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO., Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (6 columns), and is furnished more valuable reading matter than any other weekly journal in California.

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with THE TIMES—which cannot be obtained from books. THE MINING AND SCIENTIFIC PRESS is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1887:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

TERMS OF SUBSCRIPTION.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

As AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate. SPECIMEN NUMBERS of the PAPER and Patent Circulars, sent free.

By MAIL.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

Pacific File, Reaper and Mower Section MANUFACTORY, No. 53 Beale Street, between Market and Mission, SAN FRANCISCO.

Files re-cut and warranted as good as new, or no charge. The only establishment in the State. We also manufacture Reapers and Mowers of various patterns. RIDDELL & DUBRING, Props. Generous Compliments. The following is a sample of the generous acknowledgments which we frequently receive. We can only thank for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness.

# Engineering and Scientific Process.

Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,  
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 2, 1867.

VOLUME XV.  
Number 18.

## TABLE OF CONTENTS.

Miller's Patent Boiler—Illustration.	Mechanical Miscellany—Working Steam Expansively; Letlar's Welding Composition; A Great Furnace Chimney.
Prof. Blake's Letter from Paris.	Scientific Miscellany—The Fiber of Iron; Employment of Hydrogen Gas; Scientific Meeting; Improvement in the Blast Furnace; Evolution of Gas from Coffee; Interesting Experiment; Velocity of Signals by Electric Telegraph; To Detect Chloeky in Coffee; Cromlech; Hermetic Seal.
Formation, Distribution and Age of Igneous Rocks.	Mining Summary—Embracing late intelligence from the various counties and districts in California, Colorado, British Columbia, Idaho, Montana, Utah and Nevada.
Aerial—An English "Aviator."	San Francisco Weekly Stock Circular.
Effect of Noise on Fever Patients.	Mining Shareholders' Directories.
A Subterranean Passage.	
The Asiatic Jews.	
A New Iron Horse.	
Discovery of the Laws of Gravitation.	
The New Fog Whistle.	
Petroleum Fuel for Locomotives.	
A Virginia Gold Mine.	
The Petroleum Fuel Question.	
Mining in New Hampshire.	
A Word to the Wise.	
Iron Propeller for Coose Bay.	
New Incorporations—List of Officers.	
Notices to Correspondents.	
San Francisco Metal Market.	
San Francisco Market Rates.	
New Patents and Inventions.	
Stock Prices—Bid and Asked.	

## Miller's Patent Boiler.

In the old-fashioned furnace the heat that is absorbed by the brick walls that form the sides of the fire-box is equal to a certain amount of caloric that is abstracted from the fire, for which no equivalent is returned. But in the arrangement of this boiler all the heat is utilized and made subservient to the purpose intended.

The principal feature of the improvement herewith illustrated, consists in a series of vertical tubes or cells, arranged upon each side of the boiler and forming the side walls of the furnace. Fig. 1 represents it as applied to the common cylindrical boiler; the

The interior of these pipes or cells, Fig. 2, A, are divided vertically by a diaphragm so as to form an inner cell, as seen in sections at B, and are so constructed that while the lower part is below the fire-grate, the upper part is above the water-level. As will be seen by the view in section, they are so divided that a thin film of water is presented to the action of the fire and is almost immediately converted into dry steam, and passing into the pipe, D, Fig. 1, is there mingled with the saturated steam of the boiler. As the film of water nearest to the fire is evaporated, it is fed or supplied with water from the other divisions of the tube formed by the diaphragm. These divisions are

which paper we are indebted for the above description. Any information with reference to the same can be obtained by addressing the inventor, Joseph A. Miller, C. E., 48 Pine street, New York city.

PERSONAL.—Among the departures by the last steamer, was Hon. J. S. Mayhugh, of Aurora, State of Nevada, who goes East at this time to pay a short visit to the place of his nativity, in Carlisle, Pennsylvania. Mr. Mayhugh was among the early pioneers of California. For many years he was a resident of Grass Valley, in Nevada county, where he was well known as an enterprising miner, and where he also took considerable interest in political matters. As soon as rumors of the first discovery of silver in Washoe reached his home in Nevada county, he was among the first to cross the mountains, and render his aid in developing that new El Dorado. From that time to the present, he has been a resident there, and has aided largely in the development of that region, and in shaping the governmental policy of that State. He has been a member of the Legislature ever since the organization of the State, and always as a straight-forward, consistent Union man. We wish him a pleasant visit to the "Old Folks at Home," and a safe return to the "Silver State," whither, we understand, he will repair in the spring, to take charge of an important mining enterprise, which he has been mainly instrumental in developing, and which promises to amply reward him for all the

Fig. 1

Fig. 2

MILLER'S PATENT IMPROVEMENTS IN STEAM BOILERS.

brick-work being removed so as to show the plan more fully. The series of vertical pipes, A, are arranged upon each side of the boiler, in close proximity, and have open communication with each other at their upper and lower ends. This series of pipes are fastened to each other by bolts passing through the flanges at the transverse openings at the ends, and are also more securely fastened by iron rods that pass horizontally through the upper and lower chambers; the ends of these rods passing through the covers or caps of the chambers, and serving the double purpose of holding the caps to their places, and the series of pipes in their order.

kept supplied with the requisite amount of water by the pipe, E. The cylindrical boiler is also supplied through the tension, C, of the same pipe. By means of the globe valves, conveniently placed, the feed-water can be shut off from the boiler, or from the vertical pipes, as may be desired.

This arrangement adds more than one hundred square feet of heating surface to every kind of boiler, saving at the least twenty-five per cent. of fuel, and doubling the steam-producing capacity of most boilers, and tripling the capacity of cylindrical boilers.

This improvement was illustrated in the *American Artisan* of December 5th, 1866, to

toils and disappointments which, in common with most miners, it has thus far been his lot to encounter.

AT LAST.—A treaty has been made with the Apaches. They agree to go on the same reservation with the Camanches. The Arrapahoes, too, will treat. The Cheyennes, however, still hold back. It now remains to be seen whether our gentle friend "Lo" will stick to his agreement. There may be a good time coming for the Arizona miners.

COAL IN NEVADA.—A discovery of coal has been recently made in the Washington district.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[By our Special Correspondent.]

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California

## CALIFORNIA WINES, SEEDS AND GRAIN.

An echo from the Paris Exposition has reached me in the shape of a copy of the *Commercial Herald and Market Review*, of August 10th, containing a letter from the correspondent of the Sacramento *Bee*, about the California representation at Paris, together with a letter from Mr. Hoag, the Secretary of the State Board of Agriculture. These letters gave me the first intimation that any of the California wines were missing. On my arrival here in June, I looked over the display of wines and found those that I had invoiced and shipped to Mr. Beckwith, and found others also that I had not shipped; such, for example, as the wines of Mr. Keller, and of Kohler and Frohling, and I concluded that these last composed the shipment made by the Agricultural Society. I had no copy of that invoice, and this published letter contains the first list I have seen. Comparing this with the exhibit of wines, I find that the correspondent of the *Bee* was correct in his statement that the wines of the following contributors are not to be found, viz., those from B. N. Bughey, John Strentzel, C. Dettliand Winslow and Williams. They have not been seen here, and I fear are lost in some of the warehouses in New York, for they passed through the New York agency. I have called on the Commissioner General for an explanation. He has no invoice of that shipment, and received the packages as they were delivered, not being able to check them by any list. This was the case with a large part of the American contributions sent from the New York agency. The goods often arrived in advance of the invoices, or when invoices were in hand, the packages did not agree with them. Many packages were delivered by the French Custom House authorities, of which no advice had been received, and the contents of which could only be ascertained by opening. It was in this way that the majority of the American contributions were received and generally at the last moment, when the exhibition was about to open. The Commissioner thinks that the packages could not have reached France without being delivered in due course to him, for every package is carefully entered in the Custom Registers, and is followed by a perfect system of checks to its destination. It is my purpose, therefore, to seek for these missing wines in New York, where they were doubtless delivered by Wells, Fargo & Co.

Now with regard to the treatment our wines received at the Exposition from the jury, I participate in the general disappointment and dissatisfaction.

One of the complaints made is that there was no one here to give information officially about our wines, or place them properly before the jury; which is true. Your correspondent did not reach here until the jury had terminated its labors and made its decisions. From all that I can learn I conclude that the wines were only partially examined. Some of the contributions remain nearly intact.

This superficial and hurried regard is not surprising, when we consider what a task the wine jury had before them. This can only be appreciated by a half day's journey around the circle, where the wines of almost all the wine districts in the world are displayed. France alone, had 600 exhibitors, Spain 316, Portugal 121, and so on to the end of the list. We had no juror from the United States. The jury certainly remembered our exhibit, for they made Honorable Mention of the sparkling wine—champagne—sent by the Buena Vista Vinicultural Society of Sonoma, R. N. Van Brunt, Secretary. This wine appears to have been much liked, for it was nearly all gone (two cases) at the time of my arrival. It had evidently been a favorite with the experts.

In order to remedy the disappointment of the United States wine exhibitors (for there were many here from Ohio, Missouri, Indiana and New York), the United States

Commission appointed a committee to specially examine American wines, and make a report. This committee consisted of Mr. Flagg, of New York, Marshall P. Wilder, of Boston, and Dr. Jacob Thompson. The American wines were placed in their charge, and were tasted from time to time. The report of this committee will be made to Congress, with the other report of the commission, and will probably be printed at some distant day. I advise Californians, however, not to expect to find much in it in relation to the California wines. I had the pleasure of seeing this committee but once. They informed me that they had tested our wines, but I found that they had not noticed the San José white and red wines of Mr. Le Franc.

Some days afterwards, I had the presumption to invite several French and Russian gentlemen, judges of wine, to taste some of our samples, and they were refused by the guardian. The committee was not to be found, and so it has continued, until now, at the end of the Exhibition, the wines have been placed at my disposal; but not one bottle is to leave the building. As I have not had a single bottle out of the whole exhibit, I propose to leave them as they are until the close, and then to donate them in such a manner that the exhibitors may derive some benefit from them.

Complaint has been made about the placing of these wines—that they were heated and fermented, etc. I think this is a mistake, for I have not seen any sign of fermentation. It is true that the wines were not *iced*, nor put into the coolest possible place, but the fines spoken of were several feet distant, and would hardly be noticed by most persons. The bottles were placed cork up, except the champagnes, as is the case with the other exhibits.

This matter of heating the wine recalls the discovery made by the French chemist, Pasteur, of the existence of invisible vegetable growths in wines, which cause fermentation or disease, destructive of the good qualities. This discovery was made by the aid of the microscope, and is another example of the practical value of the instrument. M. Pasteur has also shown that the germs of this vegetable growth may be destroyed by simply heating the wine in closed vessels to a temperature of 60° centigrade, for only a few minutes. Numberless experiments have confirmed the discovery and have proved at the same time, that the operation does not injure the flavor of the wine, but on the contrary, very often improves it. I had the pleasure of tasting some of the wines which M. Pasteur had treated, and found the difference very marked in favor of the wine that had been heated, except in one instance. These wines were brought by M. Pasteur to a chemical entertainment at the laboratory of the illustrious St. Claire Deville.

The researches of Pasteur have been published in a beautiful volume by Victor Masson, and are entitled *Etudes sur le Vin*. I hope to be able to report at some length upon this process to the wine growers on my return.

The same chemist is now busily engaged in investigating the disease of the silk-worm, by the aid of the microscope. He finds that the germs of the disease may be detected in the eggs. Diseased eggs may therefore be thrown away. His method consists merely in grinding up samples of the eggs in a mortar, and placing a little of the paste under the lens. The same method has been extended to the testing of the bodies of the millers that lay the eggs.

The hale of hops mentioned in the letter to the *Bee*, is not exhausted; the demand for samples appears to have been supplied. It was a satisfaction to learn where it came from.

The seeds of Mr. Perkins, of Oakland, are handsomely arranged, and are surmounted by his photograph, showing him seated among a pile of California vegetables. He may be pleased to learn that the sign "*silver medal*" is tacked to the frame, although the jury, by some mistake, awarded it to the State of California.

The wheat sent by Mr. Campbell, and that by J. D. Peters, of Stockton, has been much admired. I have not seen any other equal to it in appearance or weight.

UNPAID LETTERS.—A wealthy gentleman of Providence, R. I., has followed the example set by similarly philanthropic gentlemen in Boston and Portland, and prepays all letters carelessly dropped into the post-office in that city without the usual embellishment of stamps.

SORE HEADS.—It is said that more than 800 protests have been received by the authorities of the Paris Exposition, against the prize decisions by the judges.

[Entered according to Act of Congress in the year 1866, by F. A. Herring, in the Clerk's Office of the District Court of the District of California.]

## Formation, Distribution and Age of Igneous Rocks.

Continued from Page 242.]

In regard to the more ancient auriferous gravel deposits, it must appear evident to the most careless observer, that great and important alterations in the geological features of the country have occurred since their formation. To say nothing of the vast period of time, a whole geological age occupied in their formation, the then existing water courses, with banks hundreds of feet in height, have been filled with volcanic *debris*, in some instances 1,000 feet in depth, turning rivers into new channels. The present system of rivers cross these ancient deposits, cutting down through them and into the hard schistose rock beneath, thousands of feet deeper, furrowing channels from the summit to the base of the Sierra Nevada, leaving those ancient deposits, in some localities, thousands of feet above the existing streams. And then consider how vast must have been the period of time for the old hills, enclosing a stream of lava which overlies an old river-bed, to disappear by natural denuding agencies, leaving a mountain of indestructible rock, whose walls are many miles in length and hundreds of feet in height above the surrounding country.

The intrusive era of metalliferous quartz probably began with the deposition of the new red sandstone, and continued through all the formations up to and including the tertiary period. As the formations included in this era are made up more largely of altered granite, porphyry, greenstone, etc., or, in other words, existing aqueous formations, that had been, to a great extent, deprived of alkaline and other metals, and consequently less readily disintegrated and decomposed than the original igneous rock, the duration of time occupied by the intrusive era of metal-bearing quartz, must have greatly exceeded that of any earlier geological age. The eruptive rock of this era is like that of the carboniferous period, non-metallic and nearly indestructible, and is found either interstratified with the formation, or overlying. A large proportion of the visible quartz veins in the Sierra Nevada were probably formed during the sixth period, and, in fact, all anticlinal or V veins, whether located at the summit, flanks or base of the mountains. There is probably a system of synclinal fissures, filled with metal-bearing quartz, which were formed by the upheavals of the old red sandstone era, located about half way between the summit and what is now the base of the Sierra Nevada.

The seventh period, or present era, began with the intrusion along anticlinal lines of non-metallic rock, similar in composition with that which was erupted at the beginning of the carboniferous era. The chain of volcanic cones which were upheaved some 125 years since in Mexico, of which Mount Jorullo is the largest—its altitude being some 1,800 feet above the surrounding plain—indicate that the crust of our globe has become solid to the non-metallic stratum. The late upheaval in the bay of Therin, in the Grecian Archipelago, brought to the surface rock of a character showing it to have been derived from a source just beneath the quartzose stratum. The upheaval was not attended by an earthquake, but was simply an intrusion of semi-molten matter. This intrusive matter is said "to consist of a rusty-black metallic lava, very heavy, and resembling half-melted scoria, which has boiled up from the furnace. It contains many whitish, semi-transparent particles disseminated through the mass, like quartz or feldspar."

It is probable that, as the earth cooled to its present temperature, the increase in thickness of its crust was nearly the same in all its parts. Igneous rocks are somewhat better conductors of heat than aqueous rocks, but this influence must be limited, as the only connection of the surface igneous rocks with the mass beneath, is by means of narrow dykes or veins. The matter of

which the stratified rocks are composed, with the exception of such of the elements as existed in the atmosphere before water rested upon the earth, has been brought to the surface by volcanic action. In framing the diagram I have assumed that, while 7,000 feet of stratified rock were being deposited, the crust increased in thickness twelve miles, and while 42,000 feet—the probable average thickness of the aqueous stratum—were being deposited the crust increased to about seventy-two miles, its present probable thickness. This estimate is necessarily an approximation, yet it will answer to illustrate the idea. Now if we assume, or admit that the molten matter which has been brought to the surface by volcanic action, was derived from a constantly increasing depth, in consequence of the constantly increasing thickness of the solid crust, it follows that we are provided with an infallible rule for determining the age of upheavals, by ascertaining the mineral character and composition of the intrusive matter contained in the fissures, which were formed during the process of mountain-making.

If we find granite intruded in veins or cones along an ancient anticlinal axis, we know the upheaval occurred no later than the third or silurian period. If the intrusive rock is feldspathic granite, we know the upheaval occurred during the old red sandstone period, and so every variety of igneous rocks has, in succession, its intrusive era, marking the date of upheavals. As metalliferous quartz was erupted during the same era that feldspathic granite was intruded along anticlinal lines, we may expect to find deposits of the ores of the precious metals flanking those ancient anticlinal lines in all such localities where active volcanoes existed. Vast deposits of mineral wealth, whose existence has not hitherto been suspected, await the future explorer, who is thus directed where he may look for them.

Judging from the intrusive rocks which are found in anticlinal fissures, the general upheaval of the Sierra Nevada began during the formation of the silurian system. It is probable, however, that occasional ridges, the nuclei of the present system, were permanently raised above the water as early as the gneiss formation; but during the silurian period there seems to have been an upheaval of extended ridges, running in a northerly and southerly direction.

AERIAL.—The following account of the extraordinary voyage of a balloon is extracted from a recent English paper: An extraordinary balloon, shaped like a monster fish, fell in a field close by the railway at Montnessing, Essex, on the 24th ult. It contained no one in the car but the adventurous aeronaut, Mr. Orton, the deviser of the curiously-shaped machine. He had started from Cremona, where a large party had assembled to see the start; and as a gale was then blowing, some fears were entertained for the safety of the voyager. On being released from its moorings, the "great fish" rose with frightful rapidity, and passed over London towards the northeast at a rate which took it out of sight in six minutes; Mr. Orton states that he sailed from Cremona—a distance, in a straight line, of more than 20 miles—in a little more than a quarter of an hour. Owing to the strong wind he had some difficulty in descending safely, and had it not been for prompt assistance the balloon would doubtless have been lost. The aeronaut sustained a few bruises from being dragged over the hedges and ditches, in the course of which he lost the grapnel.

The above will serve to exemplify some of the advantages and disadvantages attended on this mode of traveling. Excepting the steering and propelling apparatus, the general form of the above appears to coincide with the outlines of the Avitor.

EFFECT OF NOISE ON FEVER PATIENTS.—Recent observations have shown that the ordinary noises, as rumbling over pavements, ringing of bells, etc., are terribly fatal to persons in severe cases of fever. The practice of ringing bells, where sickness is very prevalent or epidemic, it is proposed, should be stopped. A thunder-storm is known to have recently killed several fever patients in Galveston.

THERE are now 118 Bessemer converters in operation in Europe, capable of producing the enormous amount of 9,000 tons of steel per week. England has 52 of the number, Prussia 22, France 12, Austria 14, Sweden 15, Belgium 1, and Italy 2.

## Mechanical.

## Working Steam Expansively.

All engineers agree that to work steam economically it must be worked expansively; but engineers disagree as to the best method of constructing engines in which steam is expanded. The value of the principle is recognized, but wide differences of opinion may be met with as to the way in which the principle should be applied in practice. Although this diversity of opinion has acted as a stimulus to invention, it is more than probable that the progress of the steam engine toward the perfection of economy has been retarded by its existence. Men have sought to attain the same end by different means; very grave mistakes have been made; much money expended to no purpose, and a fair proportion of talent wasted in consequence. This is bad enough, but the waste of time, money and talent does not represent the worst. Engines theoretically right in principle but practically faulty in construction have been forced upon the market, purchased, and worked to the disgust of purchasers. The general public of manufacturers, ship-owners and other employers of steam power seldom dive deeply below the surface of things, or take much pains to draw distinctions between theoretical and practical shortcomings. In other words, all shortcomings represent practical commercial losses, and thus if a mistake is made in the method adopted in carrying out any principle—say that of expansion—the fault is attributed quite as much to the influence of the principle as to the lack of skill, knowledge or perception of mechanical fitness in the engineer. Thus, if a manufacturer of cotton thread buys an engine which he is assured is constructed on such a principle that it will save him much money in coal, and this engine is constantly out of repair, he will be almost certain to attribute the fact to the principle, not to the maker, provided only that the workmanship appears good. If the workmanship is bad, that is a different affair; but even then he will be unwilling to think that the expense of applying the principle must be so great that he cannot expect to obtain first-class workmanship and the principle together for the price of first-class workmanship only. In this way an idea grew up many years ago, and is still sufficiently prevalent, that an engine to work expansively must be complex, and therefore liable to get out of order. There is just such a basis of truth lying below this theory that it is difficult to combat it, and there can be no doubt that, as a result, engines in which the principle of expansion is fairly carried out do not receive that general recognition of their value as representing a good principle which they deserve. We shall not attempt to prove that complication does not necessarily mean a liability to disarrangement; those who have dealt with complex machines know better than to be led into error by any reasoning on the subject. In our eyes complication is a monstrosity in engineering. We wish it, of course, to be understood that we use the word with reasonable limitations. A machine is not necessarily complicated because it has a great number of parts, provided no fewer can be used to obtain a required end; but complexity commences the moment a single unnecessary part or motion is introduced. We shall, therefore, not dispute with those who assert that complicated steam machinery is more liable to get out of order than simple steam machinery; but we believe it may be shown that the fullest benefit which the principle can confer may be derived from expansion in engines of exceedingly simple construction; that no multiplication of parts or motions are necessary or desirable in such engines as compared with those in which steam is not greatly expanded, and that, in short, the whole question is one far more of proportion and arrangement of the members of a design than of anything else. Complexity in steam machinery generally represents the embodiment of the crochets of an inventor, seldom or never the necessities of practice.

Inventors have done their best and their worst with pistons, cylinders, connecting-rods and guides; but those members of the entire machine have such straightforward duties to perform, and are so simple in their nature that we seldom or never meet with any complexity in their construction or arrangement. When we turn to the means adopted for distributing steam we find that we have, so to speak, entered a new mechanical region. The patents which have been taken out for "improvements in the valves of steam engines, and the means to be employed to drive the same," may be counted by hundreds, and these most probably represent but a small proportion of all the in-

ventions in valve-gear which have been made. It may be stated, without fear of contradiction, that in complex steam engines the complexity is almost certain to exist in the valve and valve-gear, and nowhere else, in nine cases out of ten. It is not to be assumed that this complication is introduced without a purpose, and improvements in valve-gear generally "have for their object to effect a better distribution of the steam than can be had from other means." For this, then, links and cams, and double and treble eccentrics, and differential gear, and rocking-shafts, and trip-hooks, and dash-hooks, and dash-pots, and multiplicity of valves, are employed. Before we can decide how far the use of any of these things—of any arrangement, in short, more complicated than the common three-ported valve face and slide driven by a single eccentric—is justified, it is necessary to determine exactly what the best principle of distributing steam is; and, secondly, how far complex valve-gear is calculated to give better results than the gear of the simplest form. There is little trouble in doing this, although many inventors contrive to mystify themselves strangely in dealing with the subject.—*The Engineer.*

[To be Continued.]

**LEITAR'S WELDING COMPOSITION.**—We have already made a brief notice of the new composition for welding iron or steel, recently introduced by Bernard Leitar, of Brussels. The following is now given as the correct formula for its preparation, which differs somewhat from that which we gave with our first notice:

100 parts of iron or steel filings, according as the composition is intended to weld iron or steel.

60 parts of borax.  
5 parts balsamic copavia, or a resinous oil.  
10 parts ammoniacal salt (hydrochlorate, carbonate or other.)

A mixture is made of the whole, which is then calcined and reduced to powder.

The composition so prepared is used as follows: Suppose two pieces of iron or two pieces of steel, or even a piece of iron and a piece of steel should be required to be soldered or welded one to the other, place the composition between the two pieces at the place to be united; put the whole in the fire until the pieces have attained a temperature which permits the powder to become fused, which happens when the pieces have attained a cherry-red temperature; now withdraw and weld them in the usual way. If the dimensions of the pieces or any other object hinders their being put in the fire together, operate as follows: Heat first one of the pieces to a cherry-red temperature at the place where the soldering or welding is to be made; then place the composition and apply the second piece, heated this time to white, then weld the whole. This method is particularly applicable to the repair of large pieces.

**A GREAT FURNACE CHIMNEY.**—A chimney has just been completed at the works of the West Cumberland Hematite Iron Company, near Workington, Pa., the principal dimensions of which are as follows: Height above ground level, 250 feet; depth of foundation below ground level, including a bed of concrete three feet deep, 17 feet; basement, 30 feet square at the bottom, diminishing to an octagon at the ground level, pierced by four apertures for flues, each 7 feet 6 inches in diameter; outside diameter of cone, at bottom, 25 feet 7 inches; at top, 15 feet 3 inches. The cone has a straight taper of 1 in 48; thickness of brickwork in cone, 2½ bricks at bottom, diminishing by steps inside to 1½ brick at top, and including fire-brick lining. The stability of this chimney is such that it has been calculated that a pressure of wind equivalent to 55 pounds on the square foot of a flat vertical surface directly facing the wind, shall not cause the resultant pressure on any bed-joint of the brickwork to deviate from vertical axis of the chimney a distance greater than one-fourth part of the diameter.

There are upward of one thousand stationary steam engines employed within the corporate limits of the city of Philadelphia, aggregating from 25,000 to 30,000 horsepower. About one-half of the number obtain their water supply from the city water works.

**STEEL BOILERS** are coming into use on French locomotives. Twelve express engines, with steel boilers, are employed on one railway leading out of Paris, fifteen on another, and several on other roads.

## Scientific Miscellany.

## The Fiber of Iron.

We have already alluded to the experiments of M. Fresca, of Paris, who has experimented considerably with regard to the mechanical construction of metals. It will be recollected that a few months since he produced at a meeting of the Academy of Sciences, at Paris, several specimens of iron bars carefully oxidized on one side, in order to prove that these bars consisted of an assemblage of distinct fibers, each originating in one of the parts which existed separately in the original mass before pressure was applied. Each fiber could be distinctly traced by the aid of a magnifying glass from one end of the bar to the other. In connection with the above, the following from the *London Engineering*, will be read with especial interest:

When Mr. Bessemer manufactured wrought iron from cast, by blowing air into the molten metal, it was objected to the product that it had no fiber, as common puddled iron had, and that iron without fiber must be necessarily weak. In this inference—which was wholly theoretical—we did not concur, and the question then arose: What does fibrous iron really mean? When the particles of wrought iron are brought to a high temperature without the presence of an intervening material, they cohere in every direction, and the iron is not fibrous. But when slag is intermingled, as in common puddled iron is the case, there are intervening layers of either, which, when the iron is passed through rolls, are not wholly expelled, but are only greatly attenuated, and as these planes are then very numerous and pass in every longitudinal direction, they prevent to some extent the latent adhesion of the particles, which, however, adhere end to end, and a fibrous iron is thus produced. It is now well known that homogeneous iron is much stronger than fibrous iron. But at the beginning of the manufacture, fiber was accounted as necessary in iron as in ropes or thread—a theory resulting merely from the accident of the production of fiber by the modes of manufacture then exclusively employed. In the case of iron produced by the common process, any bubble or vacuity in the metal becomes filled with slag, which hinders the sides from being effectually welded under the hammer. But in the Bessemer iron, as the slag is absent, the sides of the bubble cohere when the ingot is subjected to pressure while still hot. It is better to hammer the ingots while still hot, after having been poured, than to allow them to cool and to heat them afterwards. For in the one case the heart of the ingot is the hottest part, and in the other the coldest.

**EMPLOYMENT OF HYDROGEN GAS.**—M. Heurtebise communicates to a late number of *L'Invention*, a plan for producing and economically employing hydrogen gas, which is both new and valuable. He places charcoal in a retort and raises it to a red heat, then passing a stream of carbonic acid over it, each molecule of the acid absorbs two atoms of carbon forming two molecules of oxide of carbon. In another retort, heated red hot, he passes two currents, one thus obtained, and another of superheated steam, when two atoms of carbonic acid and two equivalents of hydrogen gas result. The carbonic acid gas is again passed over the heated charcoal and four equivalents of hydrogen are obtained. A continuous action is thus kept up, with a steady supply of hydrogen.

**SCIENTIFIC MEETING.**—Peter Cooper, Wm. Cullen Bryant, and others, are arranging to hold a public meeting in New York, at an early date, under the auspices of the Association for the Advancement of Science and Art, to consider the best means of improving and cheapening transportation. On this occasion the subject of an Atlantic branch of the Union Pacific Railroad, or an air-line road from the Atlantic ocean to St. Louis, is to be discussed. Another improvement in the form of an extensive canal, to connect with the railroad, is proposed.

**IMPROVEMENT IN THE BLAST FURNACE.**—A French journal states that M. Morgan has increased the production of iron in furnaces six-fold by giving them greater dimensions; for instance, 9½ meters diameter (nearly 30 feet), and blowing into them by 12 tuyeres. A hollow cone is also constructed in the middle of the furnace, through which another blast is introduced.

**EVOLUTION OF GAS FROM COFFEE.**—At a recent meeting of the French Academy of Sciences, the following information, useful to be known in the chemical world, was communicated by M. Babinet, with regard to the evolution of gas during the process of making coffee. If finely ground roasted coffee be steeped in cold water, gas will be evolved to an extent about equal in volume to the quantity of coffee used; and this action will take place very rapidly, inasmuch that if a bottle be half filled with coffee duly ground, and the remaining space then filled with water until the cork is reached, an explosion will ensue, sufficient in force to expel the cork, or even break the bottle.

**AN INTERESTING EXPERIMENT.**—A very interesting experiment, which will be new to most of our readers, is described in a recent number of *Cosmos*. A large bell-glass full of air is placed over water, and a slow stream of mixed hydrogen and atmospheric air is sent so that the bubbles of gas as they escape from the water pass between the points of a small Ruhmkorff coil. Each bubble is thus ignited by the sparks, but instead of resulting in a sudden explosion the lighted bubbles seem to continue their course in the bell-glass, describing a series of curves. Thus, when the experiment is made in the dark, the glass is seen full of small flames which dart about and cross each other in all directions, looking as though the bell-glass was full of fire-flies.

**VELOCITY OF SIGNALS BY ELECTRIC TELEGRAPH.**—At the recent meeting at Burlington, Vt., of the American Association for the Advancement of Science, Dr. Gould read a paper on the "Velocity of transmission of signals by telegraph." Previous to the year 1849, it was supposed that the velocity of electricity through wires was too great to be measured. In that year, Sears C. Walker discovered, while measuring longitude, a perceptible retardation. Between Washington and St. Louis the velocity was found to be only 15,000 miles per second. On the submarine cable between Greenwich and Brussels the velocity was only 8,000 or 9,000 miles. On the Atlantic cable, Prof. Gould found the velocity to be between 7,000 and 8,000 miles per second, being greatest when the circuit was made by the two cables.

**TO DETECT CHICORY IN COFFEE.**—In a late number of the *Philosophical Magazine*, Dr. Draper gives a simple means of guessing more or less accurately, at the amount of chicory present in mixtures of coffee and that adulterant. Chicory, almost every body knows in these days, sinks in water immediately, while coffee floats; and Dr. Draper, therefore, takes a tube and draws out the closed end to a narrower diameter than the upper part. The drawn-out end, into which the chicory sinks, he graduates into four equal divisions, and thus is able to arrive at the proportion present in samples. This mode of testing is applicable to the estimation of other adulterants besides chicory, for nearly all the substances that have been found mixed with coffee, sink in water.

**CROMLECH.**—M. de Closmadeuc has discovered in a small desert island in the Bay of Morbihan, France, a very fine Cromlech containing more than sixty obelisks of granite, forming a regular circular of 180 meters in circumference. A curious fact is that only one half this Cromlech, which is supposed to have been a Druidical altar, is now on a dry land, owing to the encroachments of the sea. M. de Closmadeuc has made large excavations in the neighborhood, and discovered an enormous quantity of pottery, similar to that found in Celtic monuments; also several hundred flints worked by man, as well as a large number of stone hatchets.

**HERMETIC SEAL.**—A mixture of gelatine and glycerine, is liquid while hot, but on cooling it becomes solid, retaining considerable elasticity and toughness. The neck of a bottle dipped into this melted compound is covered with an air-tight cap, which can be made as thick as desired by repeating the operation.

**CEROLINE.**—Prof. Tozzetti, of Florence, has presented a note to the French Academy of Sciences on the wax produced by the fig cochineal (*coccus coriaceus*), which contains about half its weight of ceroline. He states that it may be procured in such large quantities as warrant its use in the industrial arts.

The *London Builder*, in an article on the prospective or possible exhaustion of the English coal fields, suggests, as a practicable resort, the employment of the tidal power in the direct production of heat, by compressing air.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

**A NEW QUARTZ MILL.**—The Virginia *Trespass* gives a lengthy notice of a new quartz mill, recently invented by Col. John A. Collins, of Virginia, and which was recently subjected to a preliminary trial at Bassett's mill. The invention consists of a series of cast iron wheels, each wheel constituting a cylinder similar in its operation to a Freiherg barrel; with the addition of the pan process, by the use of heavy iron cylinders inside, while the wheel, in rotating upon its bed, also accomplishes the crushing action due to the Chili wheel. The wheels are rotated by a heavy circular plate, which surmounts and rests upon the wheels; by which means the driving power is applied to their circumference, instead of their axis. A large amount of intervening machinery and friction is thereby saved, and, of course, much less power required. The *Trespass* sums up the advantages of this mill as follows:

- First—In cheapness. A mill of fifty tons capacity will cost not one-fourth the price of a mill with stamps and pans of similar capacity.
- Second—It will require only one-half the power to drive it.
- Third—It will not require one-fifth the room.
- Fourth—It is vastly less liable to disarrangement, and hence a great saving of expense for repairs.
- Fifth—It can be worked with less than one-half the number of hands.
- Sixth—It will not require one-half the water.
- Seventh—It will crush the quartz dry nearly as rapidly as with water.
- Eighth—It will allow the mountains of low grade ores now worthless, to be worked to a profit to both the mine and the mill.

It is estimated that silver ore can be crushed and amalgamated by this machine for \$3 per ton, with a mill of a capacity for reducing 100 tons for each 24 hours, while the space which the machine would occupy will not exceed 20 feet square. The first experiment made with it was the reduction of 1,200 pounds of ore, with a result of 70 per cent. of the assay. The quicksilver was in the pulp but one hour, when it should have been there three hours. The result obtained under such circumstances shows not only the superior effectiveness of the machine, but that it will work exceedingly close to the assay.

**A WONDERFUL INVENTION—PHOTOGRAPHY APPLIED TO ENGRAVING.**—Ever since the discovery of the Daguerrean process, it has been an object of earnest pursuit to find a method of using the photographic art for the production of metallic types, or plates from which to print, in the ordinary letter press style, the pictures made by the sun. Scores of inventions have been made without final success; but according to the *New York Journal of Commerce*, the desideratum has at last been accomplished.

It is not claimed for this process as yet that it will do everything that is desired. But it is the beginning of great things, and the day is confidently anticipated when it will be so perfected that the scenes of daily life, occurrences in our streets, public meetings, processions, and similar events may be photographed and the type used in the editions of illustrated newspapers without the intervention of an engraver or wood-cutter.

The editors of that paper have been the witnesses of some of the results of this wonderful discovery, which they describe as follows:

At present the inventors wisely propose to do no more for the public than they are able to do perfectly. To show their ability, a copper-plate map of France was handed to them, from which they were to produce a type or plate suitable for letter-press work. Within twelve hours they delivered the type, a solid plate, from which we could easily print a hundred thousand copies on the press of the *Journal of Commerce*. The

copy printed from this type was a *fac simile*. An elegant ornamental card, being placed in their hands, they, in a few hours, produced a type from which the card can be printed to any extent desired. An ordinary wood engraving is reproduced in the same manner. Music is admirably and perfectly copied.

One of the merits of the invention consists in the ability to change the size of the picture or page to be reproduced. A map six feet square can be reduced, and the type made to print an illustration for an ordinary volume. A page of the *London Illustrated News* was reproduced in a few hours in a metal plate, half the original size, the proofs from which will surprise any printer.

The editor adds: "We have been careful not to claim too much for this invention in its present working condition."

**TO PREVENT OVER-WINDING.**—Much ingenuity has been employed both in this country and in Europe to prevent accidents from over-winding, by an automatic detachment of the cage or bucket from the hoisting apparatus before it is drawn over the winch or head-gear, or dashed against the hoisting pulley and beams overhead, through the inattention of the engineer, or some derangement in the machinery. Accidents from such a cause are not unfrequent. Mr. Frank Thayer, head engineer of the *Savage* works, at Virginia City, has perfected an apparatus to accomplish this purpose, which is so arranged that upon rising to a certain height the cable is detached, so that the cage remains suspended by a patent safety apparatus between the guide bars of the shaft. Upon being detached from the cable the cage only falls an inch or two before being brought to a stand still by stout steel clutches which spring out and fasten like great chisels into the wooden guides upon which the cable plays in ascending and descending the shaft.

**NAPOLEON'S NEW CANNON.**—Much has been said about a new cannon recently invented by the present Emperor of France—but which was not exhibited at the Paris Exposition. But little has hitherto been learned with regard to it; but it now seems that something has finally leaked out, probably through some person connected with its trial, and which is given in a *Toulouse paper* as follows:

The trial of the new small cannon, the most terrible arm yet invented, continues at Mendon. None know their mechanism, except the artillery officers, who direct the experiments. Cannon, carriages and ammunition are brought in leather valises, and the trials take place behind a screen of planks. All that can be known is that at 2,500 meters these arms send a perfect hail of balls against a target two meters high and one broad. At that distance the balls pierce an iron plate two centimeters thick. Each cannon can fire twenty shots in a minute, and two men suffice for the transport of the arm, the carriage, the ammunition, etc. Lately the guns were tried against a clump of trees at 1,500 meters (nearly an English mile). The trees were mowed down in a few minutes, like a cornfield by a steam mowing machine. It is frightful. Five or six men armed with such an engine could destroy a whole regiment in a few minutes.

PATENTS RECENTLY ISSUED.

69,139.—**ROCK DRILL.**—John S. Stockham, Red Dog, Cal.

I claim the drill constructed with the drill-rod, E, the tappet, F, spring, G, and cam, I, operating in the swinging frame, D, supported by standard, B, for giving universal motion, substantially as described.

This invention relates to machines for drilling rock, and consists in providing what is claimed as an improved mechanism for directing the drill to any desired point, and also for giving more effective blows, especially in confined places. This object is attained by constructing a double frame or any other convenient mechanism by which a universal joint can be obtained, so as to allow the drill to be pointed in any direction. The drill stock extends longitudinally across the frame, and has a tappet fixed to the back part of it, behind which is a spring sufficiently stiff to pierce the drill forward and give the desired blow, as soon as the tappet is released by the cam. The cam shaft crosses the frame transversely, and has a cam so placed as to operate the tappets; cranks being fixed at each end of the shaft to turn it. The drill is fed forward by means of a hand wheel. It is claimed that with this machine, driven by hand, much more work can be done, than by use of the sledge; while it has the additional advantage of being used in places where an ordinary drill and sledge could not be employed for lack of room.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 2, 1887.

City Stocks.

City stocks continue dull and little or no change has taken place in current quotations. We note more than usual transactions in Spring Valley Water at \$68@67 50. A few shares of California Steam Navigation sold at 75@75 1/2 per cent. San Francisco Gas stock realized \$65 per share. The usual monthly dividend is payable since yesterday.

The certificate of incorporation of the People's Insurance Company has been filed in the office of the County Clerk. The amount of capital stock is stated at \$100,000, divided into 1,000 shares of \$100 each. The Directors for the first twelve months are C. F. McDermot, John Flanagan, H. W. Bradley, George T. Knox, A. Jacoby, James E. Damon, Philip Meagher, B. Mendessolle, William Fishel, D. Murphy, A. Eberhart, John H. Wise, and William Dumphy. Principal place of business, this city and county. The company reserves the privilege of increasing its capital stock to \$300,000 at any time.

The following is a carefully compiled record of the daily aggregate sales in the open and regular sessions of the San Francisco Stock and Exchange Board during the month of October:

	Regular Session.	Open Session.
October 1.....	\$270,246	\$88,469
October 2.....	407,546	90,810
October 3.....	334,512	119,472
October 4.....	233,105	124,882
October 5.....	234,705	124,464
October 6.....	310,238	103,541
October 7.....	290,075	83,422
October 8.....	230,961	79,228
October 9.....	155,343	82,720
October 10.....	227,592	135,980
October 11.....	140,533	119,710
October 12.....	214,330	97,285
October 13.....	214,824	124,928
October 14.....	109,501	54,344
October 15.....	188,339	92,607
October 16.....	138,938	55,726
October 17.....	105,438	121,828
October 18.....	194,747	95,095
October 19.....	225,152	120,829
October 20.....	190,232	124,262
October 21.....	182,732	61,630
October 22.....	175,118	112,829
October 23.....	113,338	93,614
October 24.....	138,930	76,830
October 25.....	163,552	70,100
October 26.....	233,041	78,506
October 27.....	205,819	61,821
October 28.....		
October 29.....		
October 30.....		
October 31.....		
Total.....	\$5,470,842	\$2,580,497

Making a total of \$8,051,329. These figures compare as follows with the transactions of the same months in the three preceding years, viz: 1864, \$1,604,612; 1865, \$4,000,500; 1866, 1,375,117. The sales for the month just closed exceed the transactions of any previous month since the organization of the Board. No afternoon open session has been held since the 29th instant.

Legal Tender Notes advanced to 71%, the sales in the Board being very considerable.

Mining Share Market.

The mining share market since Saturday last has been quite active, though the decline in a number of leading stocks has been very marked. The reports from the various claims on the Comstock Lode are certainly not very encouraging; however, the market has been influenced by strong bear movements, which greatly tended towards precipitating the general list. The market closed weak.

**CROWN POINT**—has been quite active during the period under review, experiencing a very material decline, falling from \$625 to \$565, improving to \$595, dropping to \$505, and closing at \$520. A telegram of yesterday states that the north drift, on the 700-foot level, is in quartz containing clay with some pay ore, and that the south drift is producing some ore that will pay. The clay seam of the ledge has been penetrated on this level. Nothing new to report concerning the 500 and 600-foot levels. The hullion receipts in October, it is thought, will exceed the September returns. Upwards of sixty tons of ore are mined per day, which will mill about \$40 to the ton.

**HALE & NORCROSS**—shows a decided improvement, as well as increased sales over last week, advancing from \$690 to \$880, then selling at \$800, and closing yesterday at \$835. In drifting from the north winze, (780-foot level) at a depth of fifty feet, the ore is found to be about four feet wide, and has improved some in quality. From the south winze, on the same level, they have opened northward and found the ore to be from two and a half to three feet wide. A winze has been sunk on the "west raise" to the depth of twenty-five feet, obtaining ore four feet wide, said to be of a fair quality. They can go no deeper in this winze at present on account of the heavy flow of water. The average sixty-five per cent. yield of the ore extracted during the present month is \$24 to the ton.

**CHOLLAR-PODOSI**—exhibited a fair degree of activity under variable rates, rising from \$162 50 to \$202 50, falling to \$161, and at the close selling at \$160. During the week ending October 24th, 1,586 tons of ore were sent to custom mills; previous week, 1,425 tons. The comparative

yield of the various levels has been as follows:

	Oct. 25.	Oct. 19.
New Santa Fe.....	182 tons.	260 tons.
Plute.....	580 "	450 "
Old Santa Fe.....	360 "	394 "
Santa Fe 3d.....	897 "	456 "
Total.....	1,789 "	1,570 "

The force at work in the fifth station have discovered nothing of an encouraging nature in the drifts, nor is there any very cheering information as regards developments in other portions of the mine. Considerable quantities of ore continue to be daily extracted, the ship of the 29th October showing a product of 307 tons.

**YELLOW JACKET**—has been in less favor, receding from \$352 to \$320, and closing at \$330 seller 3. We could learn nothing new relative to the present condition of this mine.

**GOULD & CURRY**—sold to a limited extent, obtaining \$330@310, and at the close \$330 is asked. The receipts of hullion during the month of October amounted to \$65,474 86, against \$75,842 74 in September. The condition of the mine is about the same as previously reported.

**SAVAGE**—has been in less favor at declining rates, selling at \$116 50@103, and closing yesterday at \$101. The amount of ore extracted during the past two weeks compare as follows:

	Tons.	Value per Ton.
October 19th.....	1,844	\$58 90
October 28th.....	1,321	38 55

The north and south mines on the third level yielded 895 tons, and from the north mine on the seventh station 740 tons were taken. The north breasts on the third station are said to continue in fair ore, while the breasts in the south mine on the same level do not look quite so well as when first opened. The operations in other portions of the mine have not, as yet, produced any favorable developments. The main shaft is twenty feet below the fifth station, and is running in good ground.

**KENTUCKY**—was in the market to a large extent, upwards of 1,800 shares changing hands, opening at \$173, dropping to \$139, under heavy sales, rallying to \$156, and closing at \$146. We could learn nothing very encouraging from this mine. The hullion product for October will fall considerably short of the September yield.
